LMR16006

# LMR16006 SIMPLE SWITCHER ${ }^{\circledR} 60$ V 0.6 A Buck Regulators With High Efficiency ECO Mode 

## 1 Features

- Ultra Low $28 \mu \mathrm{~A}$ Standby Current in ECO Mode
- Input Voltage Range 4 V to 60 V
- $1 \mu \mathrm{~A}$ Shutdown Current
- High Duty Cycle Operation Supported
- Output Current up to 600 mA
- 0.7 MHz and 2.1 MHz Switching Frequency
- Internal Compensation
- High Voltage Enable Input
- Internal Soft Start
- Over Current Protection
- Over Temperature Protection
- Small Overall Solution Size (SOT-6L Package)
- Create a Custom Design Using the LMR16006 with the WEBENCH Power Designer

## 2 Applications

- Industrial Distributed Power Systems
- Automotive
- Battery Powered Equipment
- Portable Handheld Instruments
- Portable Media Players

## 4 Simplified Schematic

## 3 Description

The LMR16006 is a PWM DC/DC buck (step-down) regulator. With a wide input range of 4 V to 60 V , it is suitable for a wide range of application from industrial to automotive for power conditioning from an unregulated source. The regulator's standby current is $28 \mu \mathrm{~A}$ in ECO mode, which is suitable for battery operating systems. An ultra low $1 \mu \mathrm{~A}$ shutdown current can further prolong battery life. Operating frequency is fixed at 0.7 MHz ( X version) and 2.1 MHz ( Y version) allowing the use of small external components while still being able to have low output ripple voltage. Soft-start and compensation circuits are implemented internally, which allows the device to be used with minimized external components. The LMR16006 is optimized for up to 600 mA load currents. It has a 0.765 V typical feedback voltage. The device has built-in protection features such as pulse by pulse current limit, thermal sensing and shutdown due to excessive power dissipation. The LMR16006 is available in a low profile SOT-6L package.

## Pin Functions

| PIN |  | I/O | DESCRIPTION |  |
| :---: | :---: | :---: | :--- | :---: |
| NAME | NUMBER |  |  |  |
| CB | 1 | I | Switch FET gate bias voltage. Connect $\mathrm{C}_{\text {boot }}$ cap between CB and SW . |  |
| GND | 2 | G | Ground connection. |  |
| FB | 3 | I | Feedback Input. Set feedback voltage divider ratio with $\mathrm{V}_{\text {OUT }}=\mathrm{V}_{\mathrm{FB}}$ (1+(R1/R2)). |  |
| SHDN | 4 | I | Enable and disable input (high voltage tolerant). Internal pull-up current source. Pull below <br> 1.25 V to disable. Float to enable. Establish input undervoltage lockout with two resistor <br> divider. |  |
| $\mathrm{V}_{\text {IN }}$ | 5 | I | Power input voltage pin. Input for internal supply and drain node input for internal high-side <br> MOSFET. |  |
| SW | 6 | O | Switch node. Connect to inductor, diode, and $\mathrm{C}_{\text {boot }}$ cap. |  |

## 7 Specifications

### 7.1 Absolute Maximum Ratings ${ }^{(1)}$

|  |  | MIN | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| Input Voltages | $\mathrm{V}_{\text {IN }}$ to GND | -0.3 | 65 | V |
|  | $\overline{\text { SHDN }}$ to GND | -0.3 | 65 |  |
|  | FB to GND | -0.3 | 7 |  |
|  | CB to SW | -0.3 | 7 |  |
| Output Voltages | SW to GND | -0.3 | 65 |  |
|  | SW to GND less than 30 ns transients | -2 | 65 |  |
| $\mathrm{T}_{\text {J Operation Junction temperature }}$ |  | -40 | 150 | ${ }^{\circ} \mathrm{C}$ |

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.2 Handling Ratings

|  |  |  | MIN | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{\text {stg }}$ | Storage temperature range |  | -55 | 165 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{V}_{\text {(ESD) }}$ | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ${ }^{(1)}$ |  | 2000 | V |
|  |  | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ${ }^{(2)}$ |  | 500 |  |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted) (1)

|  |  | MIN | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| Buck Regulator | $\mathrm{V}_{\text {IN }}$ | 4 | 60 | V |
|  | CB | 4 | 66 |  |
|  | CB to SW | -0.3 | 6 |  |
|  | SW | -0.3 | 60 |  |
|  | FB | 0 | 5.5 |  |
| Control | $\overline{\text { SHDN }}$ | 0 | 60 |  |
| Temperature | Operating junction temperature range, $\mathrm{T}_{J}$ | -40 | 125 | ${ }^{\circ} \mathrm{C}$ |

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.4 Thermal Information

over operating free-air temperature range (unless otherwise noted)

|  |  | THERMAL METRIC ${ }^{(1)}$ | SOT <br> (6 PINS) |
| :--- | :--- | :---: | :---: |
| $R \theta_{\text {JA }}$ | Junction-to-ambient thermal resistance | 102 |  |
| $R \theta_{\text {JCtop }}$ | Junction-to-case (top) thermal resistance | 36.9 |  |
| $R \theta_{\mathrm{JB}}$ | Junction-to board characterization parameter | 28.4 | $\mathrm{C} / \mathrm{W}$ |

(1) All numbers apply for packages soldered directly onto a $3^{\prime \prime} \times 3^{\prime \prime}$ PC board with 2 oz. copper on 4 layers in still air in accordance to JEDEC standards. Thermal resistance varies greatly with layout, copper thickness, number of layers in PCB, power distribution, numberof thermal vias, board size, ambient temperature, and air flow.

## 8 Detailed Description

### 8.1 Overview

The LMR16006 device is a $60 \mathrm{~V}, 600 \mathrm{~mA}$, step-down (buck) regulator. The buck regulator has a very low quiescent current during light load to prolong battery life.
LMR16006 improves performance during line and load transients by implementing a constant frequency, current mode control which requires less output capacitance and simplifies frequency compensation design. Two switching frequency options, 0.7 MHz and 2.1 MHz , are available, thus smaller inductor and capacitor can be used. The LMR16006 reduces the external component count by integrating the boot recharge diode. The bias voltage for the integrated high side MOSFET is supplied by a capacitor on the CB to SW pin. The boot capacitor voltage is monitored by an UVLO circuit and will turn the high side MOSFET off when the boot voltage falls below a preset threshold. The LMR16006 can operate at high duty cycles because of the boot UVLO and refresh the wimp FET. The output voltage can be stepped down to as low as the 0.8 V reference. Internal soft-start is featured to minimize inrush currents.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

### 8.3.1 Fixed Frequency PWM Control

The LMR16006 has two fixed frequency options, and it implements peak current mode control. The output voltage is compared through external resistors on the $\mathrm{V}_{\mathrm{FB}}$ pin to an internal voltage reference by an error amplifier which drives the internal COMP node. An internal oscillator initiates the turn on of the high side power switch. The error amplifier output is compared to the high side power switch current. When the power switch current reaches the level set by the internal COMP voltage, the power switch is turned off. The internal COMP node voltage will increase and decrease as the output current increases and decreases. The device implements a current limit by clamping the COMP node voltage to a maximum level.

### 8.3.2 Bootstrap Voltage (CB)

The LMR16006 has an integrated boot regulator, and requires a small ceramic capacitor between the CB and SW pins to provide the gate drive voltage for the high side MOSFET. The CB capacitor is refreshed when the high side MOSFET is off and the low side diode conducts. To improve drop out, the LMR16006 is designed to operate at $100 \%$ duty cycle as long as the CB to SW pin voltage is greater than 3 V . When the voltage from CB to SW drops below 3 V , the high side MOSFET is turned off using an UVLO circuit which allows the low side diode to conduct and refresh the charge on the CB capacitor. Since the supply current sourced from the CB capacitor is low, the high side MOSFET can remain on for more switching cycles than are required to refresh the capacitor, thus the effective duty cycle of the switching regulator is high. Attention must be taken in maximum duty cycle applications with light load. To ensure SW can be pulled to ground to refresh the CB capacitor, an internal circuit will charge the CB capacitor when the load is light or the device is working in dropout condition.

### 8.3.3 Output Voltage Setting

The output voltage is set using the feedback pin and a resistor divider connected to the output as shown on the front page schematic. The feedback pin voltage 0.765 V , so the ratio of the feedback resistors sets the output voltage according to the following equation: $\mathrm{V}_{\text {OUT }}=0.765 \mathrm{~V}(1+(\mathrm{R} 1 / \mathrm{R} 2))$. Typically R 2 will be given as $1 \mathrm{k} \Omega-100$ $\mathrm{k} \Omega$ for a starting value. To solve for R 1 given R 2 and Vout uses $\mathrm{R} 1=\mathrm{R} 2\left(\left(\mathrm{~V}_{\mathrm{OUT}} / 0.765 \mathrm{~V}\right)-1\right)$.

### 8.3.4 Enable $\overline{\text { SHDN }}$ and VIN Undervoltage Lockout

LMR16006 $\overline{\text { SHDN }}$ pin is a high voltage tolerant input with an internal pull up circuit. The device can be enabled even if the SHDN pin is floating. The regulator can also be turned on using 1.23 V or higher logic signals. If the use of a higher voltage is desired due to system or other constraints, a $100 \mathrm{k} \Omega$ or larger resistor is recommended between the applied voltage and the $\overline{\text { SHDN }}$ pin to protect the device. When $\overline{\mathrm{SHDN}}$ is pulled down to 0 V , the chip is turned off and enters the lowest shutdown current mode. In shutdown mode the supply current will be decreased to approximately $1 \mu \mathrm{~A}$. If the shutdown function is not to be used the $\overline{S H D N}$ pin may be tied to $\mathrm{V}_{\mathbb{I N}}$ via $100 \mathrm{k} \Omega$ resistor. The maximum voltage to the SHDN pin should not exceed 60 V . LMR16006 has an internal UVLO circuit to shutdown the output if the input voltage falls below an internally fixed UVLO threshold level. This ensures that the regulator is not latched into an unknown state during low input voltage conditions. The regulator will power up when the input voltage exceeds the voltage level. If there is a requirement for a higher UVLO voltage, the SHDN can be used to adjust the system UVLO by using external resistors.

### 8.3.5 Current Limit

The LMR16006 implements current mode control which uses the internal COMP voltage to turn off the high side MOSFET on a cycle-by-cycle basis. Each cycle the switch current and internal COMP voltage are compared, when the peak switch current intersects the COMP voltage, the high side switch is turned off. During overcurrent conditions that pull the output voltage low, the error amplifier will respond by driving the COMP node high, increasing the switch current. The error amplifier output is clamped internally, which functions as a switch current limit.

### 8.3.6 Overvoltage Transient Protection

The LMR16006 incorporates an overvoltage transient protection (OVTP) circuit to minimize voltage overshoot when recovering from output fault conditions or strong unload transients on power supply designs with low value output capacitance. For example, when the power supply output is overloaded the error amplifier compares the actual output voltage to the internal reference voltage. If the FB pin voltage is lower than the internal reference voltage for a considerable time, the output of the error amplifier will respond by clamping the error amplifier

## Feature Description (continued)

output to a high voltage. Thus, requesting the maximum output current. Once the condition is removed, the regulator output rises and the error amplifier output transitions to the steady state duty cycle. In some applications, the power supply output voltage can respond faster than the error amplifier output can respond, this actuality leads to the possibility of an output overshoot. The OVTP feature minimizes the output overshoot, when using a low value output capacitor, by implementing a circuit to compare the FB pin voltage to OVTP threshold which is $108 \%$ of the internal voltage reference. If the FB pin voltage is greater than the OVTP threshold, the high side MOSFET is disabled preventing current from flowing to the output and minimizing output overshoot. When the FB voltage drops lower than the OVTP threshold, the high side MOSFET is allowed to turn on at the next clock cycle.

### 8.3.7 Thermal Shutdown

The device implements an internal thermal shutdown to protect itself if the junction temperature exceeds $170^{\circ} \mathrm{C}$ (typ). The thermal shutdown forces the device to stop switching when the junction temperature exceeds the thermal trip threshold. Once the junction temperature decreases below $160^{\circ} \mathrm{C}($ typ $)$, the device reinitiates the power up sequence.

### 8.4 Device Functional Modes

### 8.4.1 Continuous Conduction Mode

The LMR16006 steps the input voltage down to a lower output voltage. In continuous conduction mode (when the inductor current never reaches zero at CCM), the buck regulator operates in two cycles. The power switch is connected between $\mathrm{V}_{\mathbb{I N}}$ and SW. In the first cycle of operation the transistor is closed and the diode is reverse biased. Energy is collected in the inductor and the load current is supplied by Cout and the rising current through the inductor. During the second cycle the transistor is open and the diode is forward biased due to the fact that the inductor current cannot instantaneously change direction. The energy stored in the inductor is transferred to the load and output capacitor. The ratio of these two cycles determines the output voltage. The output voltage is defined approximately as: $\mathrm{D}=\mathrm{V}_{\mathrm{OUT}} / \mathrm{V}_{\mathbb{I N}}$ and $\mathrm{D}^{\prime}=(1-\mathrm{D})$ where D is the duty cycle of the switch, D and $\mathrm{D}^{\prime}$ will be required for design calculations.

### 8.4.2 ECO Mode

The LMR16006 operates in ECO mode at light load currents to improve efficiency by reducing switching and gate drive losses. The LMR16006 is designed so that if the output voltage is within regulation and the peak switch current at the end of any switching cycle is below the sleep current threshold, $\mathrm{I}_{\text {InDuctor }} \leq 80 \mathrm{~mA}$, the device enters ECO mode. For ECO mode operation, the LMR16006 senses peak current, not average or load current, so the load current where the device enters ECO mode is dependent on $\mathrm{V}_{\mathbb{I}}, \mathrm{V}_{\text {OUT }}$ and the output inductor value. When the load current is low and the output voltage is within regulation, the device enters an ECO mode and draws only $28 \mu \mathrm{~A}$ input quiescent current.

## 9 Application and Implementation

## NOTE

Information in the following applications sections is not part of the Tl component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The LMR16006 is a step down DC-to-DC regulator. It is typically used to convert a higher DC voltage to a lower DC voltage with a maximum output current of 600 mA . The following design procedure can be used to select components for the LMR16006. This section presents a simplified discussion of the design process.

### 9.2 Typical Application

Figure 9. Application Circuit, 5 V Output

### 9.2.1 Design Requirements

Table 1. Design Example Parameters

| Input Voltage, $\mathrm{V}_{\mathrm{IN}}$ | 9 V to 16 V , Typical 12 V |
| :--- | :--- |
| Output Voltage, $\mathrm{V}_{\text {Out }}$ | $5.0 \mathrm{~V} \pm 3 \%$ |
| Maximum Output Current $\mathrm{I}_{\mathrm{O} \text { _max }}$ | 0.6 A |
| Minimum Output Current $\mathrm{I}_{\mathrm{O} \text { min }}$ | 0.03 A |
| Transient Response 0.03 A to 0.6 A | $5 \%$ |
| Output Voltage Ripple | $1 \%$ |
| Switching Frequency Fsw | 0.7 MHz |
| Target during Load Transient | Over Voltage Peak Value |

### 9.2.2 Detailed Design Procedure

### 9.2.2.1 Custom Design with WEBENCH Tools

Click here to create a custom design using the LMR16006 device with the WEBENCH ${ }^{\circledR}$ Power Designer.

1. Start by entering your $\mathrm{V}_{\mathbb{N}}, \mathrm{V}_{\text {OUt }}$ and $\mathrm{I}_{\text {OUT }}$ requirements.
2. Optimize your design for key parameters like efficiency, footprint and cost using the optimizer dial and compare this design with other possible solutions from Texas Instruments.
3. WEBENCH Power Designer provides you with a customized schematic along with a list of materials with real time pricing and component availability.
4. In most cases, you will also be able to:

- Run electrical simulations to see important waveforms and circuit performance,
- Run thermal simulations to understand the thermal performance of your board,
- Export your customized schematic and layout into popular CAD formats,
- Print PDF reports for the design, and share your design with colleagues.

5. Get more information about WEBENCH tools at www.ti.com/webench.

This example details the design of a high frequency switching regulator using ceramic output capacitors. A few parameters must be known in order to start the design process. These parameters are typically determined at the system level:

### 9.2.2.2 Output Inductor Selection

The most critical parameters for the inductor are the inductance, peak current and the DC resistance. The inductance is related to the peak-to-peak inductor ripple current, the input and the output voltages. Since the ripple current increases with the input voltage, the maximum input voltage is always used to determine the inductance. To calculate the minimum value of the output inductor, use Equation $1 . \mathrm{K}_{\mathrm{IND}}$ is a coefficient that represents the amount of inductor ripple current relative to the maximum output current. A reasonable value is setting the ripple current to be $30 \%-40 \%$ of the DC output current. For this design example, the minimum inductor value is calculated to be $20.4 \mu \mathrm{H}$, and a nearest standard value was chosen: $22 \mu \mathrm{H}$. For the output filter inductor, it is important that the RMS current and saturation current ratings not be exceeded. The RMS and peak inductor current can be found from Equation 3 and Equation 4. The inductor ripple current is 0.22 A , and the RMS current is 0.602 A . As the equation set demonstrates, lower ripple currents will reduce the output voltage ripple of the regulator but will require a larger value of inductance. A good starting point for most applications is $22 \mu \mathrm{H}$ with a 1.6 A current rating. Using a rating near 1.6 A will enable the LMR16006 to current limit without saturating the inductor. This is preferable to the LMR16006 going into thermal shutdown mode and the possibility of damaging the inductor if the output is shorted to ground or other long-term overload.

$$
\begin{align*}
& L_{o \min }=\frac{V_{\text {in } \max }-V_{\text {out }}}{I_{o} \times K_{\text {IND }}} \times \frac{V_{\text {out }}}{V_{\text {in } \max } \times f_{\text {sw }}}  \tag{1}\\
& I_{\text {ripple }}=\frac{V_{\text {out }} \times\left(V_{\text {in } \max }-V_{\text {out }}\right)}{V_{\text {in } \max } \times L_{o} \times f_{\text {sw }}}  \tag{2}\\
& I_{L-R M S}=\sqrt{I_{o}{ }^{2}+\frac{1}{12} I_{\text {ripple }}^{2}}  \tag{3}\\
& I_{L-\text { peak }}=I_{o}+\frac{I_{\text {ripple }}}{2} \tag{4}
\end{align*}
$$

### 9.2.2.3 Output Capacitor Selection

The selection of Cout is mainly driven by three primary considerations. The output capacitor will determine the modulator pole, the output voltage ripple, and how the regulator responds to a large change in load current. The output capacitance needs to be selected based on the most stringent of these three criteria.

The desired response to a large change in the load current is the first criteria. The regulator usually needs two or more clock cycles for the control loop to see the change in load current and output voltage and adjust the duty cycle to react to the change. The output capacitance must be large enough to supply the difference in current for 2 clock cycles while only allowing a tolerable amount of droop in the output voltage. Equation 5 shows the minimum output capacitance necessary to accomplish this. The transient load response is specified as a $3 \%$ change in $\mathrm{V}_{\text {OUT }}$ for a load step from 0.03 A to 0.6 A (full load), $\Delta \mathrm{l}_{\text {OUT }}=0.6-0.03=0.57 \mathrm{~A}$ and $\Delta \mathrm{V}_{\text {OUT }}=0.03 \times 5=$ 0.15 V . Using these numbers gives a minimum capacitance of $10.8 \mu \mathrm{~F}$. For ceramic capacitors, the ESR is usually small enough to ignore in this calculation. Aluminum electrolytic and tantalum capacitors have higher ESR that should be taken into account.

The stored energy in the inductor will produce an output voltage overshoot when the load current rapidly decreases. The output capacitor must also be sized to absorb energy stored in the inductor when transitioning from a high load current to a lower load current. Equation 6 is used to calculate the minimum capacitance to keep the output voltage overshoot to a desired value. Where L is the value of the inductor, $\mathrm{I}_{\mathrm{OH}}$ is the output current under heavy load, $\mathrm{l}_{\mathrm{OL}}$ is the output under light load, Vf is the final peak output voltage, and Vi is the initial capacitor voltage. For this example, the worst case load step will be from 0.6 A to 0.03 A . The output voltage will increase during this load transition and the stated maximum in our specification is $3 \%$ of the output voltage. This will make Vo_overshoot $=1.03 \times 5=5.15 \mathrm{~V}$. $\mathrm{V}_{\mathrm{i}}$ is the initial capacitor voltage which is the nominal output voltage of 5 V . Using these numbers in Equation 6 yields a minimum capacitance of $5.2 \mu \mathrm{~F}$.
Equation 7 calculates the minimum output capacitance needed to meet the output voltage ripple specification. Where $f_{s w}$ is the switching frequency, $\mathrm{V}_{\mathrm{O}}$ _ripple is the maximum allowable output voltage ripple, and $\mathrm{I}_{\mathrm{L}_{\text {_ripple }}}$ is the inductor ripple current. Equation 7 yields $0.26 \mu \mathrm{~F}$.
Equation 8 calculates the maximum ESR an output capacitor can have to meet the output voltage ripple specification. Equation 8 indicates the ESR should be less than $680 \mathrm{~m} \Omega$.
Additional capacitance de-ratings for aging, temperature and dc bias should be factored in which will increase this minimum value. For this example, $10 \mu \mathrm{~F}$ ceramic capacitors will be used. Capacitors in the range of $4.7 \mu \mathrm{~F}$ $100 \mu \mathrm{~F}$ are a good starting point with an ESR of $0.7 \Omega$ or less.

$$
\begin{align*}
& C_{\text {out }}>\frac{2 \times \Delta I_{\text {out }}}{f s w \times \Delta V_{\text {out }}}  \tag{5}\\
& C_{\text {out }}>L_{o} \times \frac{\left(I o h^{2}-I o l^{2}\right)}{\left(V f^{2}-V i^{2}\right)}  \tag{6}\\
& C_{\text {out }}>\frac{1}{8 \times f s w} \times \frac{1}{\frac{V_{o-r} \text { riple }}{I_{L_{-} \text {ripple }}}}  \tag{7}\\
& R_{\text {ESR }}<\frac{V_{o_{-} \text {ripple }}}{I_{L_{-} \text {ripple }}} \tag{8}
\end{align*}
$$

### 9.2.2.4 Schottky Diode Selection

The breakdown voltage rating of the diode is preferred to be $25 \%$ higher than the maximum input voltage. In the target application, the current rating for the diode should be equal or greater to the maximum output current for best reliability in most applications. In cases where the input voltage is not much greater than the output voltage the average diode current is lower. In this case it is possible to use a diode with a lower average current rating, approximately (1-D) $\times \mathrm{I}_{\text {Out }}$. However the peak current rating should be higher than the maximum load current. A 0.5 A to 1 A rated diode is a good starting point.

### 9.2.2.5 Input Capacitor Selection

A low ESR ceramic capacitor is needed between the $\mathrm{V}_{\mathrm{IN}}$ pin and ground pin. This capacitor prevents large switching voltage transients from appearing at the input. Use a $1 \mu \mathrm{~F}-10 \mu \mathrm{~F}$ value with X5R or X7R dielectric. Depending on construction, a ceramic capacitor's value can decrease up to $50 \%$ of its nominal value when rated voltage is applied. Consult with the capacitor manufactures data sheet for information on capacitor derating over voltage and temperature. The capacitor must also have a ripple current rating greater than the maximum input current ripple of the LMR16006. The input ripple current can be calculated using below Equation 9.
For this example design, one $2.2 \mu \mathrm{~F}, 50 \mathrm{~V}$ capacitor is selected. The input capacitance value determines the input ripple voltage of the regulator. The input voltage ripple can be calculated using Equation 10. Using the design example values, $\mathrm{I}_{\text {OUT_max }}=0.6 \mathrm{~A}, \mathrm{Cin}=2.2 \mu \mathrm{~F}, f_{\mathrm{SW}}=700 \mathrm{kHz}$, yields an input voltage ripple of 97 mV and a rms input ripple current of 0.3 A .

$$
\begin{align*}
& I_{\text {cirms }}=I_{\text {out }} \times \sqrt{\frac{V_{\text {out }}}{V_{\text {in } \min }} \times \frac{\left(V_{\text {in } \min }-V_{\text {out }}\right)}{V_{\text {in } \min }}}  \tag{9}\\
& \Delta V_{\text {in }}=\frac{I_{\text {out } \max } \times 0.25}{C_{\text {in }} \times f s w} \tag{10}
\end{align*}
$$

## LMR16006

### 9.2.2.6 Bootstrap Capacitor Selection

A $0.1 \mu \mathrm{~F}$ ceramic capacitor or larger is recommended for the bootstrap capacitor ( $\mathrm{C}_{\mathrm{BOOT}}$ ). For applications where the input voltage is close to output voltage a larger capacitor is recommended, generally $0.1 \mu \mathrm{~F}$ to $1 \mu \mathrm{~F}$ to ensure plenty of gate drive for the internal switches and a consistently low $\mathrm{R}_{\text {Dson }}$. A ceramic capacitor with an X7R or X5R grade dielectric with a voltage rating of 10 V or higher is recommended because of the stable characteristics over temperature and voltage.

Table 2 represents the recommended typical output voltage inductor/capacitor combinations for optimized total solution size.

Table 2. Recommended Typical Output Voltage

| $\mathbf{P / N}$ | Vout (V) | R1 (k囚) | R2 $(\mathbf{k} \boldsymbol{\Omega})$ | $\mathbf{L}(\boldsymbol{\mu} \mathbf{H})$ | Cout $(\boldsymbol{\mu} \mathbf{F})$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| LMR16006 Y | 5 | $54.9(1 \%)$ | $10(1 \%)$ | 6.8 | 10 |
| LMR16006 Y | 12 | $147(1 \%)$ | $10(1 \%)$ | 10 | 10 |

### 9.2.3 Application Curves

Unless otherwise specified the following conditions apply: $\mathrm{V}_{\mathbb{I N}}=12 \mathrm{~V}, \mathrm{f}_{\mathrm{Sw}}=700 \mathrm{kHz}, \mathrm{L} 1=22 \mu \mathrm{H}$, Cout $=10 \mu \mathrm{~F}$, $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$

$\mathrm{V}_{\text {IN }}=12 \mathrm{~V} \quad \mathrm{~V}_{\text {OUT }}=5 \mathrm{~V} \quad \mathrm{I}_{\text {OUT }}=600 \mathrm{~mA}$

Figure 14. Start-Up

$\mathrm{V}_{\mathrm{IN}}=12 \mathrm{~V}$
$\mathrm{V}_{\text {OUT }}=5 \mathrm{~V}$

Figure 17. Short Circuit Recovery

Figure 15. Shut-Down
$\mathrm{V}_{\mathrm{IN}}=12 \mathrm{~V}$
$\mathrm{V}_{\text {OUT }}=5 \mathrm{~V}$

$$
\mathrm{V}_{\mathrm{IN}}=12 \mathrm{~V} \quad \mathrm{~V}_{\mathrm{OUT}}=5 \mathrm{~V} \quad \mathrm{I}_{\mathrm{OUT}}=600 \mathrm{~mA}
$$

Figure 16. Short Circuit Entry

## 10 Power Supply Recommendations

The LMR16006 is designed to operate from an input voltage supply range between 4 V and 60 V . This input supply should be able to withstand the maximum input current and maintain a voltage above 4 V . The resistance of the input supply rail should be low enough that an input current transient does not cause a high enough drop at the LMR16006 supply voltage that can cause a false UVLO fault triggering and system reset. If the input supply is located more than a few inches from the LMR16006, additional bulk capacitance may be required in addition to the ceramic input capacitors.

## 11 Layout

### 11.1 Layout Guidelines

Layout is a critical portion of good power supply design. The following guidelines will help users design a PCB with the best power conversion performance, thermal performance, and minimized generation of unwanted EMI.

1. The feedback network, resistors R1 and R2, should be kept close to the FB pin, and away from the inductor to minimize coupling noise into the feedback pin.
2. The input bypass capacitor Cin must be placed close to the $\mathrm{V}_{\mathrm{IN}}$ pin. This will reduce copper trace resistance which effects input voltage ripple of the IC.
3. The inductor L1 should be placed close to the SW pin to reduce magnetic and electrostatic noise.
4. The output capacitor, Cout should be placed close to the junction of L1 and the diode D1. The L1, D1, and Cout trace should be as short as possible to reduce conducted and radiated noise and increase overall efficiency.
5. The ground connection for the diode, Cin, and Cout should be as small as possible and tied to the system ground plane in only one spot (preferably at the Cout ground point) to minimize conducted noise in the system ground plane.
6. For more detail on switching power supply layout considerations see AN-1149 Layout Guidelines for Switching Power Supplies SNVA021

## 12 Device and Documentation Support

### 12.1 Custom Design with WEBENCH Tools

Click here to create a custom design using the LMR16006 device with the WEBENCH ${ }^{\circledR}$ Power Designer.

1. Start by entering your $\mathrm{V}_{\mathrm{IN}}, \mathrm{V}_{\text {OUT }}$ and $\mathrm{I}_{\text {OUT }}$ requirements.
2. Optimize your design for key parameters like efficiency, footprint and cost using the optimizer dial and compare this design with other possible solutions from Texas Instruments.
3. WEBENCH Power Designer provides you with a customized schematic along with a list of materials with real time pricing and component availability.
4. In most cases, you will also be able to:

- Run electrical simulations to see important waveforms and circuit performance,
- Run thermal simulations to understand the thermal performance of your board,
- Export your customized schematic and layout into popular CAD formats,
- Print PDF reports for the design, and share your design with colleagues.

5. Get more information about WEBENCH tools at www.ti.com/webench.

### 12.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on Alert me to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 12.3 Related Documentation

AN-1149 Layout Guidelines for Switching Power Supplies SNVA021

### 12.4 Trademarks

WEBENCH is a registered trademark of Texas Instruments.
SIMPLE SWITCHER is a registered trademark of TI.
All other trademarks are the property of their respective owners.

### 12.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 12.6 Glossary

SLYZ022 - TI Glossary.
This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

| Orderable Device | Status <br> (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan <br> (2) | Lead/Ball Finish <br> (6) | MSL Peak Temp <br> (3) | Op Temp ( ${ }^{\circ} \mathrm{C}$ ) | Device Marking <br> (4/5) | Samples |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| LMR16006XDDCR | ACTIVE | SOT-23-THIN | DDC | 6 | 3000 | Green (RoHS \& no Sb/Br) | NIPDAU | Level-1-260C-UNLIM | -40 to 125 | D02X | Samples |
| LMR16006XDDCT | ACTIVE | SOT-23-THIN | DDC | 6 | 250 | Green (RoHS \& no $\mathrm{Sb} / \mathrm{Br}$ ) | NIPDAU | Level-1-260C-UNLIM | -40 to 125 | D02X | Samples |

| LMR16006YDDCT | ACTIVE | SOT-23-THIN | DDC | 6 | 250 | Green (RoHS \& no $\mathrm{Sb} / \mathrm{Br}$ ) | NIPDAU | Level-1-260C-UNLIM | -40 to 125 | D02Y | Samples |

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption
Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a " $\sim$ " will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
