

## LM3508 Synchronous Magnetic Constant Current White LED Driver

Check for Samples: [LM3508](#)

### FEATURES

- Drives 4 Series White LEDs with up to 30mA
- >80% Peak Efficiency
- Up to 100kHz PWM Brightness Control
- Accurate  $\pm 5\%$  LED Current Regulation across  $V_{IN}$  range
- Internal Synchronous PFET (No Schottky Diode Required)
- True Shutdown Isolation
- Output Short-Circuit Protection
- 17.5V Over-Voltage Protection
- Internal Soft-Start Eliminates Inrush Current
- Wide Input Voltage Range: 2.7V to 5.5V
- 850kHz Fixed Frequency Operation
- Low Profile 9-Bump DSBGA Package (1.514mm x 1.514mm x 0.6mm)

### DESCRIPTION

The LM3508 is a synchronous boost converter (no external Schottky diode required) that provides a constant current output. It is designed to drive up to 4 series white LEDs at 30mA from a single-cell Li-Ion battery. A single low power external resistor is used to set the maximum LED current. The LED current can be adjusted by applying a PWM signal of up to 100kHz to the DIM pin. Internal soft-start circuitry is designed to eliminate high in-rush current at start-up. For maximum safety, the device features an advanced short-circuit protection when the output is shorted to ground. Additionally, over-voltage protection and an 850kHz switching frequency allow for the use of small, low-cost output capacitors with lower voltage ratings. During shutdown, the output is disconnected from the input preventing a leakage current path through the LEDs to ground. The LM3508 is available in a tiny 9-bump chip-scale DSBGA package.

### APPLICATIONS

- White LED Backlighting
- Handheld Devices
- Digital Cameras
- Portable Applications

### Typical Application Circuit

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

### PIN DESCRIPTIONS

Pin	Name	Function
A1	PGND	Power Ground Connection.
A2	SW	Inductor connection and drain connection for both NMOS and PMOS power devices.
A3	OUT	Output capacitor connection, PMOS source connection for synchronous rectifier, and OVP sensing node.
B1	ILED	Regulated current source input.
B2	DIM	Current source modulation input. A logic low at DIM turns off the internal current source. A logic high turns the LEDs fully on ( $V_{SET}=200mV$ ). Apply a PWM signal at DIM for LED brightness control.
B3	IN	Input voltage connection.
C1	SET	Current sense connection and current source output. Connect a 1% resistor ( $R_{SET}$ ) from SET to PGND to set the maximum LED current ( $I_{LED} = 200mV/R_{SET}$ ).
C2	EN	Enable input. A logic low at EN turns off the LM3508. A logic high turns the device on.
C3	AGND	Analog ground. Connect AGND to PGND through a low impedance connection.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

**ABSOLUTE MAXIMUM RATINGS<sup>(1)(2)(3)</sup>**

V <sub>IN</sub>	-0.3V to 6V
V <sub>OUT</sub>	-0.3V to 22V
V <sub>SW</sub>	-0.3V to 22V
V <sub>ILED</sub> , V <sub>SET</sub> , V <sub>DIM</sub> , V <sub>EN</sub>	-0.3V to 6V
Continuous Power Dissipation	Internally Limited
Junction Temperature	+150°C
Lead Temperature <sup>(4)</sup>	+300°C
Storage Temperature Range	-65°C to +150°C
ESD Rating <sup>(5)</sup> Human Body Model	2kV

- (1) Absolute maximum ratings are limits beyond which damage to the device may occur. Operating Ratings are conditions for which the device is intended to be functional, but device parameter may not be specified. For specifications and test conditions, see the Electrical Characteristics.
- (2) All voltages are with respect to PGND.
- (3) If Military/Aerospace specified devices are required, please contact the TI Sales Office/Distributors for availability and specifications.
- (4) For more detailed soldering information and specifications, please refer to Texas Instruments' Application Note AN-1112: DSBGA Wafer Level Chip Scale Package (Literature Number [SNVA009](#)).
- (5) The human body model is a 100pF capacitor discharged through 1.5kΩ resistor into each pin. (MIL-STD-883 3015.7).

**OPERATING CONDITIONS<sup>(1)(2)</sup>**

Input Voltage Range	2.7V to 5.5V
Ambient Temperature Range <sup>(3)</sup>	-30°C to +85°C
Junction Temperature Range	-30°C to +105°C

- (1) Absolute maximum ratings are limits beyond which damage to the device may occur. Operating Ratings are conditions for which the device is intended to be functional, but device parameters may not be specified. For specifications and test conditions, see the Electrical Characteristics.
- (2) All voltages are with respect to PGND.
- (3) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature (T<sub>A-MAX</sub>) is dependent on the maximum operating junction temperature (T<sub>J-MAX-OP</sub> = +125°C), the maximum power dissipation of the device in the application (P<sub>D-MAX</sub>), and the junction-to ambient thermal resistance of the part/package in the application (θ<sub>JA</sub>), as given by the following equation: T<sub>A-MAX</sub> = T<sub>J-MAX-OP</sub> – (θ<sub>JA</sub> × P<sub>D-MAX</sub>).

**THERMAL PROPERTIES**

Junction to Ambient Thermal Resistance (θ <sub>JA</sub> ) <sup>(1)</sup>	64.7°C/W
--	----------

- (1) Junction-to-ambient thermal resistance (θ<sub>JA</sub>) is taken from thermal modeling performed under the conditions and guidelines set forth in the JEDEC standard JESD51-7. The test board is a 4-layer FR-4 board measuring (102mm × 76mm × 1.6mm) with a 2 × 1 array of thermal vias. The ground plane on the board is (50mm × 50mm). Thickness of copper layers are (36μm/18μm/18μm/36μm) (1.5oz/1oz/1oz/1.5oz copper). Ambient temperature in simulation is +22°C, still air. Power dissipation is 1W.

## ELECTRICAL CHARACTERISTICS

Specifications in standard type face are for  $T_A = 25^\circ\text{C}$  and those in **boldface type** apply over the Operating Temperature Range of  $T_A = -30^\circ\text{C}$  to  $+85^\circ\text{C}$ . Unless otherwise specified  $V_{IN} = 3.6\text{V}$ .<sup>(1)</sup>

## OPERATION

**Figure 27. LM3508 Block Diagram**

The LM3508 utilizes a synchronous step-up current mode PWM controller and a regulated current sink to provide a highly efficient and accurate LED current for white LED bias. The internal synchronous rectifier increases efficiency and eliminates the need for an external diode. Additionally, internal compensation eliminates the need for external compensation components resulting in a compact overall solution.

[Figure 27](#) shows the detailed block diagram of the LM3508. The output of the boost converter (OUT) provides power to the series string of white LED's connected between OUT and ILED. The boost converter regulates the voltage at ILED to 500mV. This voltage is then used to power the internal current source whose output is at SET.

The first stage of the LM3508 consists of the synchronous boost converter. Operation is as follows: At the start of each switching cycle the oscillator sets the PWM controller. The controller turns the low side (NMOS) switch on and the synchronous rectifier (PMOS) switch off. During this time current ramps up in the inductor while the output capacitor supplies the current to the LED's. The error signal at the output of the error amplifier is compared against the sensed inductor current. When the sensed inductor current equals the error signal, or when the maximum duty cycle is reached, the NMOS switch turns off and the PMOS switch turns on. When the PMOS turns on, the inductor current ramps down, restoring energy to the output capacitor and supplying current to the LED's. At the end of the clock period the PWM controller is again set and the process repeats itself. This action regulates ILED to 500mV.

The second stage of the LM3508 consists of an internal current source powered by the ILED voltage and providing a regulated current at SET. The regulated LED current is set by connecting an external resistor from SET to PGND.  $V_{SET}$  is adjusted from 0 to 200mV by applying a PWM signal of up to typically 100kHz at DIM (see [TYPICAL PERFORMANCE CHARACTERISTICS](#) of SET voltage vs DIM frequency). The PWM signal at DIM modulates the internal 200mV reference and applies it to an internal RC filter resulting in an adjustable SET voltage and thus an adjustable LED current.

## Start-Up

The LM3508 features a soft-start to prevent large inrush currents during start-up that can cause excessive voltage ripple on VIN. During start-up the average input current is ramped up at a controlled rate. For the typical application circuit, driving 4LED's from a 3.6V lithium battery at 30mA, when EN is driven high the average input current ramps from zero to 160mA in 470µs. See plot of Soft Start functionality in the [TYPICAL PERFORMANCE CHARACTERISTICS](#).

## DIM Operation

DIM is the input to the gate of an internal switch that accepts a logic level PWM waveform and modulates the internal 200mV reference through an internal RC filter. This forces the current source regulation point ( $V_{SET}$ ) to vary by the duty cycle (D) of the DIM waveform making  $I_{LED} = D \times 200\text{mV} / R_{SET}$ . The cutoff frequency for the filter is approximately 500Hz. DIM frequencies higher than 100kHz cause the LED current to drastically deviate from their nominal set points. The graphs of SET voltage vs DIM frequency, SET voltage vs  $V_{IN}$  and SET voltage vs DIM duty cycle (see [TYPICAL PERFORMANCE CHARACTERISTICS](#)) show the typical variation of the current source set point voltage.

## Enable Input and Output Isolation

Driving EN high turns the device on while driving EN low places the LM3508 in shutdown. In shutdown the supply current reduces to less than 1µA, the internal synchronous PFET turns off as well as the current source (N2 in [Figure 27](#)). This completely isolates the output from the input and prevents leakage current from flowing through the LED's. In shutdown the leakage current into SW and IN is typically 400nA. EN has an internal 383kΩ pull-down to PGND.

## Peak Current Limit/Maximum Output Current

The LM3508 boost converter provides a peak current limit. When the peak inductor current reaches the peak current limit the duty cycle is terminated. This results in a limit on the maximum output power and thus the maximum output current the LM3508 can deliver. Calculate the maximum LED current as a function of  $V_{IN}$ ,  $V_{OUT}$ , L and  $I_{PEAK}$  as:

$$I_{LED\_MAX} = \frac{(I_{PEAK} - \Delta I_L) \times \eta \times V_{IN}}{V_{OUT}}$$

$$\text{where } \Delta I_L = \frac{V_{IN} \times (V_{OUT} - V_{IN})}{2 \times f_{SW} \times L \times V_{OUT}} \quad (1)$$

and  $f_{SW} = 850\text{kHz}$ . Efficiency and  $I_{PEAK}$  can be found in the efficiency and  $I_{PEAK}$  curves in the [TYPICAL PERFORMANCE CHARACTERISTICS](#).

## Output Current Accuracy

The LM3508 provides highly accurate output current regulation of ±5% over the 3V to 5.5V input voltage range. Accuracy depends on various key factors. Among these are; the tolerance of  $R_{SET}$ , the frequency at DIM ( $f_{DIM}$ ), and the errors internal to the LM3508 controller and current sink. For best accuracy, use a 1% resistor for  $R_{SET}$  and keep  $f_{DIM}$  between 1kHz and 100kHz. Refer to the [TYPICAL PERFORMANCE CHARACTERISTICS](#) for  $V_{SET}$  vs  $V_{IN}$ ,  $V_{SET}$  vs  $f_{DIM}$ , and  $V_{SET}$  vs DIM duty cycle.

## Voltage Head Room at ILED

If the LED current is increased to a point where the peak inductor current is reached, the boost converter's on-time is terminated until the next switching cycle. If the LED current is further increased the 500mV regulated voltage at ILED begins to drop. When  $V_{ILED}$  drops below the current sink headroom voltage ( $V_{HR} = 400\text{mV typ.}$ ) the current sink FET (see N2 in [Figure 27](#)) will be fully on, appearing as a 5Ω resistor between ILED and SET.

## Output Short Circuit Protection

The LM3508 provides a short circuit protection that limits the output current if OUT is shorted to PGND. During a short at OUT when  $V_{OUT}$  falls to below  $V_{IN} \times 0.93$ , switching will stop. The PMOS will turn into a current source and limit the output current to 35mA. The LM3508 can survive with a continuous short at the output. The threshold for OUT recovering from a short circuit condition is typically  $V_{IN} \times 0.95$ .

## Output Over-Voltage Protection

When the load at the output of the LM3508 goes high impedance the boost converter will raise  $V_{OUT}$  to try and maintain the programmed LED current. To prevent over-voltage conditions that can damage output capacitors and/or the device, the LM3508 will clamp the output at a maximum of 21.8V. This allows for the use of 25V output capacitors available in a tiny 1.6mm  $\times$  0.8mm case size.

During output open circuit conditions when the output voltage rises to the over voltage protection threshold ( $V_{OVP} = 19.8V$  typical) the OVP circuitry will shut off both the NMOS and PMOS switches. When the output voltage drops below 18.6V (typically) the converter will begin switching again. If the device remains in an over voltage condition the cycle will be repeated resulting in a pulsed condition at the output. See waveform for OVP condition in the [TYPICAL PERFORMANCE CHARACTERISTICS](#).

## Light Load Operation

During light load conditions when the inductor current reaches zero before the end of the switching period, the PFET will turn off, disconnecting OUT from SW and forcing the converter into discontinuous conduction. At the beginning of the next switching cycle, switching will resume. (see plot of discontinuous conduction mode in the [TYPICAL PERFORMANCE CHARACTERISTICS](#) graphs).

Boost converters that operate in the discontinuous conduction mode with fixed input to output conversion ratios ( $V_{OUT}/V_{IN}$ ) have load dependent duty cycles, resulting in shorter switch on-times as the load decreases. As the load is decreased the duty cycle will fall until the converter hits its minimum duty cycle (typically 15%). To prevent further decreases in the load current altering the  $V_{OUT}/V_{IN}$  ratio, the LM3508 will enter a pulsed skip mode. In pulse skip mode the device will only switch as necessary to keep the LED current in regulation.

## Thermal Shutdown

The LM3508 provides a thermal shutdown feature. When the die temperature exceeds +150°C the part will shutdown, turning off both the NMOS and PMOS FET's. The part will start-up again with a soft-start sequence when the die temperature falls below +115°C.

## APPLICATION INFORMATION

### Brightness Adjustment

A logic high at DIM forces SET to regulate to 200mV. Adjust the maximum LED current by picking R<sub>SET</sub> (the resistor from SET to GND) such that:

$$I_{LED\_MAX} = \frac{200 \text{ mV}}{R_{SET}} \quad (2)$$

Once I<sub>LED\_MAX</sub> is set, the LED current can be adjusted from I<sub>LED\_MAX</sub> down to I<sub>LED\_MIN</sub> by applying a logic level PWM signal to DIM. This results in:

$$I_{LED} = \frac{D \times 200 \text{ mV}}{R_{SET}} \quad (3)$$

where D is the duty cycle of the PWM pulse applied to DIM. The LM3508 can be brought out of shutdown while a signal is applied to DIM, allowing the device to turn on into a low LED current mode. A logic low at DIM will shut off the current source making I<sub>LED</sub> high impedance however, the boost converter continues to operate. Due to an offset voltage at SET (approximately +/-2mV) the LED's can faintly illuminate even with DIM pulled to GND. If zero LED current is required then pulling EN low will shutdown the current source causing the LED current to drop to zero. DIM has an internal 383kΩ pull down to PGND.

### Input Capacitor Selection

Choosing the correct size and type of input capacitor helps minimize the input voltage ripple caused by the switching action of the LM3508's boost converter. For continuous inductor current operation the input voltage ripple is composed of 2 primary components, the capacitor discharge (delta V<sub>Q</sub>) and the capacitor's equivalent series resistance (delta V<sub>ESR</sub>). The ripple due to strictly to the capacitor discharge is:

$$\Delta V_Q = \frac{\Delta I_L \times D}{2 \times f_{SW} \times C_{IN}} \quad (4)$$

The ripple due to strictly to the capacitors ESR is:

$$\Delta V_{ESR} = 2 \times I_L \times R_{ESR}$$

where 
$$\Delta I_L = \frac{V_{IN} \times (V_{OUT} - V_{IN})}{2 \times f_{SW} \times L \times V_{OUT}} \quad (5)$$

In the typical application circuit, a 1μF ceramic input capacitor works well. Since the ESR in ceramic capacitors is typically less than 5mΩ and the capacitance value is usually small, the input voltage ripple is primarily due to the capacitive discharge. With larger value capacitors such as tantalum or aluminum electrolytic the ESR can be greater than 0.5Ω. In this case the input ripple will primarily be due to the ESR.

### Output Capacitor Selection

In a boost converter such as the LM3508, during the on time, the inductor is disconnected from OUT forcing the output capacitor to supply the LED current. When the PMOS switch (synchronous rectifier) turns on the inductor energy supplies the LED current and restores charge to the output capacitor. This action causes a sag in the output voltage during the on time and a rise in the output voltage during the off time.

The LM3508's output capacitor is chosen to limit the output ripple to an acceptable level and to ensure the boost converter is stable. For proper operation use a 1μF ceramic output capacitor. Values of 2.2μF or 4.7μF can be used although start-up current and start-up time will be increased. As with the input capacitor, the output voltage ripple is composed of two parts, the ripple due to capacitor discharge (delta V<sub>Q</sub>) and the ripple due to the capacitors ESR (delta V<sub>ESR</sub>). Most of the time the LM3508 will operate in continuous conduction mode. In this mode the ripple due to capacitor discharge is given by:

$$\Delta V_Q = \frac{I_{LED} \times (V_{OUT} - V_{IN})}{f_{SW} \times V_{OUT} \times C_{OUT}} \quad (6)$$

The output voltage ripple component due to the output capacitors ESR is found by:

$$\Delta V_{ESR} = R_{ESR} \times \left( \frac{I_{LED} \times V_{IN}}{V_{IN}} + \Delta I_L \right)$$

where  $\Delta I_L = \frac{V_{IN} \times (V_{OUT} - V_{IN})}{2 \times f_{SW} \times L \times V_{OUT}}$

(7)

**Table 1. Recommended Output Capacitor Manufacturers**

Manufacturer	Part Number	Value	Case Size	Voltage Rating
Murata	GRM39X5R105K25D539	1 $\mu$ F	0603	25V
TDK	C1608X5R1E105M	1 $\mu$ F	0603	25V

### Inductor Selection

The LM3508 is designed to operate with 10 $\mu$ H to 22 $\mu$ H inductor's. When choosing the inductor ensure that the inductors saturation current rating is greater than

$$\frac{I_{LED}}{\eta} \times \frac{V_{OUT}}{V_{IN}} + \Delta I_L$$

where  $\Delta I_L = \frac{V_{IN} \times (V_{OUT} - V_{IN})}{2 \times f_{SW} \times L \times V_{OUT}}$

(8)

Additionally, the inductor's value should be large enough such that at the maximum LED current, the peak inductor current is less than the LM3508's peak switch current limit. This is done by choosing L such that

$$L > \frac{V_{IN} \times (V_{OUT} - V_{IN})}{2 \times f_{SW} \times L \times V_{OUT} \times \left( I_{PEAK} - \frac{I_{LED\_MAX} \times V_{OUT}}{\eta \times V_{IN}} \right)}$$
(9)

Values for  $I_{PEAK}$  and efficiency can be found in the plot of peak current limit vs.  $V_{IN}$  in the [TYPICAL PERFORMANCE CHARACTERISTICS](#) graphs.

**Table 2. Recommended Inductor Manufacturers**

Manufacturer	L	Part Number	Size	Saturation Current
TDK	22 $\mu$ H	VLF3010AT-220MR33	2.6mmx2.8mmx1mm	330mA
TDK	22 $\mu$ H	VLF3012AT-220MR33	2.6mmx2.8mmx1.2mm	330mA
Toko	22 $\mu$ H	D3313FB(1036FB-220M)	3.3mmx3.3mmx1.3mm	350mA

### Layout Considerations

Proper layout is essential for stable, jitter free operation, and good efficiency. Follow these steps to ensure a good layout.

- 1, Use a separate ground plane for power ground (PGND) and analog ground (AGND).
- 2, Keep high current paths such as SW and PGND connections short.
- 3, Connect the return terminals for the input capacitor and the output capacitor together at a single point as close as possible to PGND.
- 4, Connect PGND and AGND together as close as possible to the IC. Do not connect them together anywhere else.
- 5, Connect the input capacitor ( $C_{IN}$ ) as close as possible to IN.
- 6, Connect the output capacitor ( $C_{OUT}$ ) as close as possible to OUT.
- 7, Connect the positive terminal of  $R_{SET}$  as close as possible to ILED and the negative terminal as close as possible to PGND. This ensures accurate current programming.

**REVISION HISTORY**

<b>Changes from Revision B (May 2013) to Revision C</b>	<b>Page</b>
• Changed layout of National Data Sheet to TI format .....	<a href="#">14</a>

---

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples
LM3508TL/NOPB	ACTIVE	DSBGA	YZR	9	250	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-30 to 85	D 31	<a href="#">Samples</a>
LM3508TLX/NOPB	ACTIVE	DSBGA	YZR	9	3000	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-30 to 85	D 31	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**

**QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
LM3508TL/NOPB	DSBGA	YZR	9	250	178.0	8.4	1.7	1.7	0.76	4.0	8.0	Q1
LM3508TLX/NOPB	DSBGA	YZR	9	3000	178.0	8.4	1.7	1.7	0.76	4.0	8.0	Q1

**TAPE AND REEL BOX DIMENSIONS**

B. This drawing is subject to change without notice.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
