

## WIDEBAND, LOW NOISE, LOW DISTORTION FULLY DIFFERENTIAL AMPLIFIER WITH RAIL-TO-RAIL OUTPUTS

### FEATURES

- Fully Differential Architecture With Rail-to-Rail Outputs
- Centered Input Common-mode Range
- Minimum Gain of 1 V/V (0 dB)
- Bandwidth: 620 MHz
- Slew Rate: 570 V/ $\mu$ s
- 0.1% Settling Time: 7 ns
- HD<sub>2</sub>: -115 dBc at 100 kHz, V<sub>OD</sub> = 8 V<sub>PP</sub>
- HD<sub>3</sub>: -123 dBc at 100 kHz, V<sub>OD</sub> = 8 V<sub>PP</sub>
- Input Voltage Noise: 2 nV/ $\sqrt{\text{Hz}}$  (f > 10 kHz)
- Output Common-Mode Control
- Power Supply:
  - Voltage: 3.3 V ( $\pm$ 1.65 V) to 5 V ( $\pm$ 2.5 V)
  - Current: 14.2 mA
- Power-Down Capability: 15  $\mu$ A

### APPLICATIONS

- 5-V and 3.3-V Data Acquisition Systems
- High Linearity ADC Amplifier
- Wireless Communication
- Test and Measurement
- Voice Processing Systems

### RELATED PRODUCTS

Device	BW (MHz)	Slew Rate (V/ $\mu$ sec)	THD (dBc)	V <sub>N</sub> (nV/Hz)
THS4509	2000	6600	-102 at 10 MHz	1.9
THS4500	370	2800	-82 at 8 MHz	7
THS4130	150	52	-97 at 250 kHz	1.3

### DESCRIPTION

The THS4520 is a wideband, fully differential operational amplifier designed for 5-V data acquisition systems. It has very low noise at 2 nV/ $\sqrt{\text{Hz}}$ , and low harmonic distortion of -115 dBc HD<sub>2</sub> and -123 dBc HD<sub>3</sub> at 100 kHz with 8 V<sub>PP</sub>, and 1-k $\Omega$  load. The slew rate is 570 V/ $\mu$ s, and with a settling time of 7 ns to 0.1% (2-V step), it is ideal for data acquisition applications. It is designed for unity gain stability.

To allow for dc coupling to ADCs, its unique output common-mode control circuit maintains the output common-mode voltage within 0.25 mV offset (typical) from the set voltage. The common-mode set point defaults to mid-supply by internal circuitry, which may be over-driven from an external source.

The input and output are optimized for best performance with their common-mode voltages set to mid-supply. Along with high performance at low power supply voltage, this makes for extremely high performance single supply 5-V and 3.3-V data acquisition systems.

The THS4520 is offered in a Quad 16-pin leadless QFN package (RGT), and is characterized for operation over the full industrial temperature range from -40°C to 85°C.

**THS4520

vs  
FREQUENCY**

Measured HD<sub>2</sub>/HD<sub>3</sub> for G = -1, V<sub>OD</sub> = 8 V<sub>PP</sub>, R<sub>L</sub> = 1 K $\Omega$  (circuit shown on the left)

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)

		UNIT
$V_{S-}$ to $V_{S+}$	Supply voltage	6 V
$V_I$	Input voltage	$\pm V_S$
$V_{ID}$	Differential input voltage	4 V
$I_O$	Output current <sup>(1)</sup>	200 mA
Continuous power dissipation		See Dissipation Rating Table
$T_J$	Maximum junction temperature	150°C
	Maximum junction temperature, continuous operation, long term reliability	125°C
$T_A$	Operating free-air temperature range	-40°C to 85°C
$T_{stg}$	Storage temperature range	-65°C to 150°C
	Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds	300°C
ESD ratings	HBM	2000
	CDM	1500
	MM	100

(1) The THS4520 incorporates a (QFN) exposed thermal pad on the underside of the chip. See TI technical brief [SLMA002](#) and [SLMA004](#) for more information about utilizing the QFN thermally enhanced package.

## DISSIPATION RATINGS TABLE PER PACKAGE

PACKAGE <sup>(1)</sup>	$\theta_{JC}$	$\theta_{JA}$	POWER RATING	
			$T_A \leq 25^\circ\text{C}$	$T_A = 85^\circ\text{C}$
RGT (16)	2.4°C/W	39.5°C/W	2.3 W	225 mW

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI Web site at [www.ti.com](http://www.ti.com).

## DEVICE INFORMATION

## TERMINAL FUNCTIONS

TERMINAL (RGT PACKAGE)		DESCRIPTION
NO.	NAME	
1	NC	No internal connection
2	$V_{IN-}$	Inverting amplifier input
3	$V_{OUT+}$	Non-inverted amplifier output
4, 9	CM	Common-mode voltage input
5, 6, 7, 8	$V_{S+}$	Positive amplifier power supply input
10	$V_{OUT-}$	Inverted amplifier output
11	$V_{IN+}$	Non-inverting amplifier input
12	$\overline{PD}$	Powerdown, $\overline{PD}$ = logic low puts part into low power mode, $\overline{PD}$ = logic high or open for normal operation. If the PD pin is open (unterminated) the device will default to the enabled state.
13, 14, 15, 16	$V_{S-}$	Negative amplifier power supply input

**SPECIFICATIONS;  $V_{S+} - V_{S-} = 5\text{ V}$ :**

Test conditions unless otherwise noted:  $V_{S+} = +2.5\text{ V}$ ,  $V_{S-} = -2.5\text{ V}$ ,  $G = 0\text{ dB}$ ,  $CM = \text{open}$ ,  $V_O = 2\text{ V}_{PP}$ ,  $R_F = 499\ \Omega$ ,  $R_L = 200\ \Omega$  Differential,  $T_A = 25^\circ\text{C}$  Single-Ended Input, Differential Output, Input and Output Referenced to mid-supply

GAIN	R <sub>F</sub>	R <sub>G</sub>	R <sub>IT</sub>
20 dB	499 Ω	34.8 Ω	115 Ω

## TEST CIRCUITS

The THS4520 is tested with the following test circuits built on the EVM. For simplicity, power supply decoupling is not shown – see layout in the applications section for recommendations.

Figure 55. General Test Circuit for Device Testing and Characterization

Depending on the test conditions, component values are changed per the following tables, or as otherwise noted. The signal generators used are ac coupled 50-Ω sources and a 0.22-μF capacitor and a 49.9-Ω resistor to ground are inserted across R<sub>IT</sub> on the alternate input to balance the circuit. A split power supply is used to ease the interface to common test equipment, but the amplifier can be operated single-supply as described in the applications section with no impact on performance.

Table 1. Gain Component Values

GAIN	R <sub>F</sub>	R <sub>G</sub>	R <sub>IT</sub>
0 dB	499 Ω	487 Ω	53.6 Ω
6 dB	499 Ω	243 Ω	57.6 Ω
10 dB	499 Ω	147 Ω	63.4 Ω
14 dB	499 Ω	88.7 Ω	71.5 Ω

**Note:** The gain setting includes 50-Ω source impedance. Components are chosen to achieve gain and 50-Ω input termination.

Table 2. Load Component Values

R <sub>L</sub>	R <sub>O</sub>	R <sub>OT</sub>	Atten.
100 Ω	25 Ω	open	6 dB
200 Ω	86.6 Ω	69.8 Ω	16.8 dB
499 Ω	237 Ω	56.2 Ω	25.5 dB
1 kΩ	487 Ω	52.3 Ω	31.8 dB
2 k	976	51.1	-37.86

**Note:** The total load includes 50-Ω termination by the test equipment. Components are chosen to achieve load and 50-Ω line termination through a 1:1 transformer.

Due to the voltage divider on the output formed by the load component values, the amplifier's output is attenuated in test. The column *Atten* in Table 2 shows the attenuation expected from the resistor divider. When using a transformer at the output the signal will have slightly more loss, and the numbers will be approximate.

## Frequency Response

The general circuit shown in Figure 55 is modified as shown in Figure 56, and is used to measure the frequency response of the device.

A network analyzer is used as the signal source and as the measurement device. The output impedance

of the network analyzer is 50 Ω.  $R_{IT}$  and  $R_G$  are chosen to impedance match to 50 Ω, and to maintain the proper gain. To balance the amplifier, a 0.22-μF capacitor and 49.9-Ω resistor to ground are inserted across  $R_{IT}$  on the alternate input.

The output is probed using a high-impedance differential probe across the 100-Ω resistor. The gain is referred to the amplifier output by adding back the 6-dB loss due to the voltage divider on the output.

Figure 56. Frequency Response Test Circuit

**S-Parameter, Slew Rate, Transient Response, Settling Time, Output Voltage**

The circuit shown in Figure 57 is used to measure s-parameters, slew rate, transient response, settling time, and output voltage swing.

Because S21 is measured single-ended at the load with 50-Ω double termination, add 12 dB to see the amplifier's output as a differential signal.

Figure 57. S-Parameter, SR, Transient Response, Settling Time,  $V_{OUT}$  Swing

**CM Input**

The circuit shown in Figure 58 is used to measure the frequency response of the CM input. Frequency response is measured single-ended at  $V_{OUT+}$  or  $V_{OUT-}$  with the input injected at  $V_{IN}$ ,  $R_{CM} = 0 \Omega$  and  $R_{CMT} = 49.9 \Omega$ .

Figure 58. CM Input Test Circuit

## APPLICATION INFORMATION

### APPLICATIONS

The following circuits show application information for the THS4520. For simplicity, power supply decoupling capacitors are not shown in these diagrams. For more detail on the use and operation of fully differential op amps see application report *Fully-Differential Amplifiers (SLOA054)*.

#### Differential Input to Differential Output Amplifier

The THS4520 is a fully differential op amp, and can be used to amplify differential input signals to differential output signals. A basic block diagram of the circuit is shown in [Figure 59](#) (CM input not shown). The gain of the circuit is set by  $R_F$  divided by  $R_G$ .

**Figure 59. Differential Input to Differential Output Amplifier**

Depending on the source and load, input and output termination can be accomplished by adding  $R_{IT}$  and  $R_O$ .

#### Single-Ended Input to Differential Output Amplifier

The THS4520 can be used to amplify and convert single-ended input signals to differential output signals. A basic block diagram of the circuit is shown in [Figure 60](#) (CM input not shown). The gain of the circuit is again set by  $R_F$  divided by  $R_G$ .

**Figure 60. Single-Ended Input to Differential Output Amplifier**

#### Input Common-Mode Voltage Range

The input common-mode voltage of a fully differential op amp is the voltage at the '+' and '-' input pins of the op amp.

It is important to not violate the input common-mode voltage range ( $V_{ICR}$ ) of the op amp. Assuming the op amp is in linear operation, the differential voltage across the input pins is only a few millivolts at most. So finding the voltage at one input pin determines the input common-mode voltage of the op amp.

Treating the negative input as a summing node, the voltage is given by [Equation 1](#):

$$V_{IC} = \left( V_{OUT+} \times \frac{R_G}{R_G + R_F} \right) + \left( V_{IN-} \times \frac{R_F}{R_G + R_F} \right) \quad (1)$$

To determine the  $V_{ICR}$  of the op amp, the voltage at the negative input is evaluated at the extremes of  $V_{OUT+}$ .

As the gain of the op amp increases, the input common-mode voltage becomes closer and closer to the input common-mode voltage of the source.

#### Setting the Output Common-Mode Voltage

The output common-mode voltage is set by the voltage at the CM pin. The internal common-mode control circuit maintains the output common-mode voltage within 0.25-mV offset (typical) from the set voltage, when set within  $\pm 0.5$  V of mid-supply. If left unconnected, the common-mode set point is set to mid-supply by internal circuitry, which may be over-driven from an external source. [Figure 61](#) is representative of the CM input. The internal CM circuit has about 230 MHz of bandwidth, which is

required for best performance, but it is intended to be a DC bias input pin. Bypass capacitors are recommended on this pin to reduce noise at the output. The external current required to overdrive the internal resistor divider is given by Equation 2:

$$I_{EXT} = \frac{2V_{CM} - (V_{S+} - V_{S-})}{50\text{ k}\Omega} \quad (2)$$

where  $V_{CM}$  is the voltage applied to the CM pin.

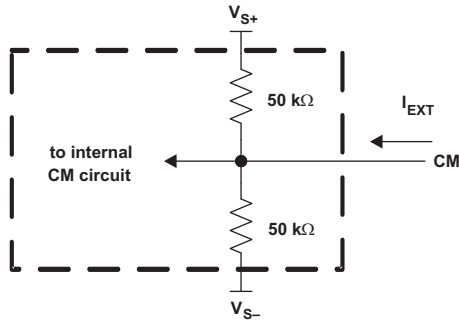

Figure 61. CM Input Circuit

**Powerdown Operation: Device Enable/Disable Thresholds**

The enable/disable thresholds of the THS4520 are dependent upon the power supplies, and the thresholds are always referenced to the lower power supply rail. The device is enabled or disabled for the following conditions:

- Device enabled:  $V_{PD} > V_{S-} + 0.8 \times (V_{S+} - V_{S-})$
- Device disabled:  $V_{PD} < V_{S-} + 0.2 \times (V_{S+} - V_{S-})$

If the  $\overline{PD}$  pin is left open, the device will default to the enabled state.

Table 3 shows the thresholds for some common power supply configurations:

Table 3. Power Supply Configurations

Power Supply ( $V_{S+}$ , $V_{S-}$ )	Enable Threshold (V)	Disable Threshold (V)	Comment
$\pm 2.5\text{ V}$	1.5	-1.5	Shown in data table
$\pm 1.65\text{ V}$	1	-1	Shown in data table
(4 V, -1 V)	3	0	Split, unbalanced supplies
(5 V, gnd)	4	1	Single-sided supply
(3.3 V, gnd)	2.64	0.66	Single-sided supply
(3 V, gnd)	2.4	0.6	Single-sided supply

**Single-Supply Operation (3 V to 5 V)**

To facilitate testing with common lab equipment, the THS4520 EVM allows split-supply operation, and the characterization data presented in this data sheet was taken with split-supply power inputs. The device can easily be used with a single-supply power input without degrading the performance. Figure 62, Figure 63, and Figure 64 show DC and AC-coupled single-supply circuits with single-ended inputs. These configurations all allow the input and output common-mode voltage to be set to mid-supply allowing for optimum performance. The information presented here can also be applied to differential input sources.

In Figure 62, the source is referenced to the same voltage as the CM pin ( $V_{CM}$ ).  $V_{CM}$  is set by the internal circuit to mid-supply.  $R_T$  along with the input impedance of the amplifier circuit provides input termination, which is also referenced to  $V_{CM}$ .

Note  $R_S$  and  $R_T$  are added to the alternate input from the signal input to balance the amplifier. Alternately, one resistor can be used equal to the combined value  $R_G + R_S || R_T$  on this input. This is also true of the circuits shown in Figure 63 and Figure 64.

Figure 62. THS4520 DC Coupled Single-Supply with Input Biased to  $V_{CM}$

In Figure 63 the source is referenced to ground and so is the input termination resistor.  $R_{PU}$  is added to the circuit to avoid violating the  $V_{ICR}$  of the op amp. The proper value of resistor to add can be calculated from Equation 3:

$$R_{PU} = \frac{(V_{IC} - V_{S+})}{V_{CM} \left( \frac{1}{R_F} \right) - V_{IC} \left( \frac{1}{R_{IN}} + \frac{1}{R_F} \right)} \quad (3)$$

$V_{IC}$  is the desired input common-mode voltage,  $V_{CM} = CM$ , and  $R_{IN} = R_G + R_S || R_T$ . To set to mid-supply, make the value of  $R_{PU} = R_G + R_S || R_T$ .

Table 4 is a modification of Table 1 to add the proper values with  $R_{PU}$  assuming a 50- $\Omega$  source impedance and setting the input and output common-mode voltage to mid-supply.

There are two drawbacks to this configuration. One is it requires additional current from the power supply. Using the values shown for a gain of 0 dB requires 10 mA more current with 5-V supply, and 6.5 mA more current with 3.3-V supply.

The other drawback is this configuration also increases the noise gain of the circuit. In the 10-dB gain case, noise gain increases by a factor of 1.7.

Table 4. RPU Values for Various Gains

Gain	$R_F$	$R_G$	$R_{IT}$	$R_{PU}$
0 dB	499 $\Omega$	487 $\Omega$	54.9 $\Omega$	511 $\Omega$
6 dB	499 $\Omega$	243 $\Omega$	59 $\Omega$	270 $\Omega$
10 dB	499 $\Omega$	150 $\Omega$	68.1 $\Omega$	178 $\Omega$
14 dB	499 $\Omega$	93.1 $\Omega$	82.5 $\Omega$	124 $\Omega$
20 dB	499 $\Omega$	40.2 $\Omega$	221 $\Omega$	80.6 $\Omega$

Figure 63. THS4520 DC Coupled Single-Supply with  $R_{PU}$  Used to Set  $V_{IC}$

Figure 64 shows AC coupling to the source. Using capacitors in series with the termination resistors allows the amplifier to self-bias both input and output to mid-supply.

Figure 64. THS4520 AC Coupled Single-Supply

## FULLY DIFFERENTIAL AMPLIFIER WITH REDUCED PEAKING

Figure 65 shows a fully differential amplifier that reduces peaking at low gains. The resistor  $R_C$  compensates the THS4520 to have higher noise gain (NG), which reduces the AC response peaking (typically 3.8dB at  $G = +1$  without  $R_C$ ) without changing the DC forward gain. The input signal,  $V_{IN}$ , is assumed to be from a low impedance source, such as an op amp.

When the two feedback paths are symmetrical, the noise gain is given by the expression:

$$NG = 1 + \frac{R_F}{R_G} + \frac{2R_F}{R_C} \quad (4)$$

Figure 65. THS4520 with Noise Gain Compensation

A unity-gain buffer can be designed by selecting  $R_F = 499 \Omega$ ,  $R_G = 499 \Omega$  and  $R_C = \text{open}$ . The resulting forward gain response is similar to the characteristics plots with  $G = 0\text{dB}$  (see Figure 1), and the noise gain equal to 2. If  $R_C$  is then made equal to 200  $\Omega$  the noise gain increases to 7, which typically gives a frequency response with less peaking and with less bandwidth, and the forward gain remains equal to unity.

The plot in Figure 66 shows the measured small-signal AC response of a THS4520 EVM in the default unity-gain configuration (see Figure 72). When the termination resistors present on the EVM ( $R_1$ ,  $R_2$ , and  $R_{12}$  in Figure 72) and the source resistance of the signal generator ( $R_S = 50 \Omega$ ) are taken into account, the calculated noise gain of the default EVM is  $NG = 1.97$ . Also included in the plot are two curves which represent the measured response of the same board with two values of  $R_C$ , one with  $R_C = 200 \Omega$  ( $NG = 6.96$ ) and one with  $R_C = 487 \Omega$  ( $NG = 4.02$ ). The low-frequency roll-off of the AC response is due to the transformer (T1 in Figure 72). The curves illustrate the reduced peaking

and the reduced bandwidth due to increased noise gain when the circuit is configured for low forward gain. Note that using noise gain compensation increases the circuit output noise and decreases the circuit bandwidth. Compared to the default configuration (no  $R_C$ ) using  $R_C = 200 \Omega$  and  $R_C = 487 \Omega$  increases the circuit output noise by approximately 10.9dB and 6dB respectively.

Figure 66. THS4520 EVM Small Signal Response With and Without Noise Gain Compensation

### DC ERRORS IN A FULLY DIFFERENTIAL AMPLIFIER

#### Summary

A DC error model of a fully differential voltage feedback amplifier shown in the following circuit diagram. The output error has four contributing factors in this model:

1. Input offset voltage ( $V_{IO}$ ).
2. Input offset current ( $I_{IO}$ ).
3. Input bias currents ( $I_{IB+}$ ,  $I_{IB-}$ ) interacting with mismatched feedback networks.
4. Mismatch between input and output common-mode voltages interacting with the mismatched feedback networks.

When there is no mismatch between the feedback networks ( $RF_1 = RF_2$  and  $RG_1 = RG_2$ ) the output error due to the input offset voltage is given by:

$$\Delta V_{OD}(V_{IO}) = V_{IO} \frac{RG + RF}{RG} = V_{IO}/\beta \tag{5}$$

where  $\beta$  is often called the *feedback factor*.

$$\beta = \frac{RG}{RG + RF} \tag{6}$$

For additional information, see the applications note *Fully Differential Amplifiers* (SLOA054).

The output error due to the input offset current is given by:

$$\Delta V_{OD}(I_{IO}) = I_{IO}RF \tag{7}$$

If there is mismatch ( $RF_1 \neq RF_2$  or  $RG_1 \neq RG_2$ ), then the output error due to the input bias currents is:

$$\Delta V_{OD}(I_{IB}, I_{IO}) = 2 \frac{I_{IB}(R_{EQ1} - R_{EQ2}) + I_{IO}(R_{EQ1} + R_{EQ2})}{(\beta_1 + \beta_2)} \tag{8}$$

Where  $I_{IB} = (I_{IB+} + I_{IB-})/2$ ,  $R_{EQ1,2} = RF_{1,2} \parallel RG_{1,2}$  and  $\beta_{1,2} = RG_{1,2}/(RG_{1,2} + RF_{1,2})$ .

There is an additional contribution to the output error if the input and output common-mode voltages are mismatched:

$$\Delta V_{OD}(V_{OCM}, V_{ICM}) = 2 \times (V_{OCM} - V_{ICM}) \frac{(\beta_1 - \beta_2)}{(\beta_1 + \beta_2)} \tag{9}$$

Note that this source of output error will be negligible if the two feedback paths are well matched. The analysis that leads to the results shown above is beyond the scope of this section. An applications note that shows the detailed analysis will be available in the near future.

### DEPENDENCE OF HARMONIC DISTORTION ON DEVICE OUTPUT SWING AND SIGNAL FREQUENCY

Typical plots of HD2 or HD3 usually show the dependence of these parameters upon a single variable, like frequency, output swing, load, or circuit gain. Operating conditions of interest are usually dependent on several variables that are often spread across several different plots. This forces the designer to interpolate across several plots in an attempt to capture the parameters and operating conditions for his/her application.

Unlike typical plots where HD2 or HD3 is plotted against a single variable, the plots below show constant contours of THS4520 HD2 and HD3 plotted against the joint parameters of device output swing and signal frequency. These two parameters are of

particular interest because their joint interaction reflects the usable slewing and bandwidth limits of a device. Output swing and frequency limits are often prime consideration when picking a device and quantifying their joint impact on HD allows a more precise judgment on the ability of a device to meet the *need for speed*. The curves that separate each colored region represent the value of HD<sub>2,3</sub> indicated on the plot. Following a curve over the ranges of output swing and frequency show the conditions over which that value of HD<sub>2,3</sub> occurs.

Note that the horizontal axis represents the base-10 logarithm of frequency in units of MHz. So on the horizontal axis the value of '2' represents 100 MHz, '1' represents 10 MHz and '0' represents 1 MHz, respectively. This strategy was chosen to provide spacing between curves that allowed the viewer to easily resolve the individual curves. Plotting frequency on a linear scale caused the curves to be crowded and difficult to distinguish. Unfortunately a semilog axis format was not possible because of the plotting function. The measured data in the plots

represent measurements of a THS4520 evaluation board in the default unity-gain configuration with  $R_L = 200\Omega$ . For more information on the circuit configuration, see the information on the THS4520 evaluation board later in this section.

The first two plots (Figure 67 and Figure 68) are for HD<sub>2</sub> and HD<sub>3</sub> respectively, with a power supply of  $\pm 2.5\text{ V}$ . The line labeled *Large Signal BW* in each of the two plots represents the measured large signal bandwidth over the range of output signal swing in the plot ( $V_{out} = 1\text{ V}_{pp}$  to  $8\text{ V}_{pp}$ ). The BW lines fall in the shaded region that represents very poor distortion performance: HD<sub>2</sub> > -45dBc or HD<sub>3</sub> > -40dBc. The intent in plotting the bandwidth was to provide a realistic comparison between the reported large signal bandwidth and useful distortion performance. The areas between the plots are shaded to help illustrate the 10dB changes in HD<sub>2</sub> or HD<sub>3</sub> between the adjacent curves. The third and fourth plots (Figure 69 and Figure 70) are the constant contours of HD<sub>2</sub> and HD<sub>3</sub> respectively for a power supply of  $\pm 1.65\text{ V}$ .

Figure 67. Constant HD<sub>2</sub> Contours vs Output Swing and  $\log_{10}$  (Frequency - MHz)  
 $V_s = 2.5\text{ V}$ , Gain = 1,  $R_L = 200\ \Omega$

Figure 68. Constant HD3 Contours vs Output Swing and  $\log_{10}$  (Frequency - MHz)  
 $V_s = 2.5\text{ V}$ , Gain = 1,  $R_L = 200\ \Omega$

Figure 69. Constant HD2 Contours vs Output Swing and  $\log_{10}$  (Frequency - MHz)  
 $V_s = 1.65\text{ V}$ , Gain = 1,  $R_L = 200\ \Omega$

Figure 70. Constant HD2 Contours vs Output Swing and  $\log_{10}$  (Frequency - MHz)  
 $V_s = 1.65 \text{ V}$ , Gain = 1,  $R_L = 200 \Omega$

### Layout Recommendations

It is recommended to follow the layout of the external components near the amplifier, ground plane construction, and power routing of the EVM as closely as possible. General guidelines are:

1. Signal routing should be direct and as short as possible into and out of the op amp circuit.
2. The feedback path should be short and direct avoiding vias.
3. Ground or power planes should be removed from directly under the amplifier's input and output pins.
4. An output resistor is recommended on each output, as near to the output pin as possible.
5. Two 10- $\mu\text{F}$  and two 0.1- $\mu\text{F}$  power-supply decoupling capacitors should be placed as near to the power-supply pins as possible.
6. Two 0.1- $\mu\text{F}$  capacitors should be placed between the CM input pins and ground. This limits noise coupled into the pins. One each should be placed to ground near pin 4 and pin 9.
7. It is recommended to split the ground plane on layer 2 (L2) as shown below and to use a solid ground on layer 3 (L3). A single-point connection should be used between each split section on L2 and L3.

8. A single-point connection to ground on L2 is recommended for the input termination resistors R1 and R2. This should be applied to the input gain resistors if termination is not used.
9. The THS4520 recommended PCB footprint is shown in Figure 71.

Figure 71. QFN Etch and Via Pattern

THS4520 EVM

Figure 72 is the THS4520 EVAL1 EVM schematic, layers 1 through 4 of the PCB are shown Figure 73, and Table 5 is the bill of material for the EVM as supplied from TI.

### EVM WARNINGS AND RESTRICTIONS

It is important to operate this EVM within the input voltage range of 3 V to 5 V and the output voltage range of 3 V to 5 V.

Exceeding the specified input range may cause unexpected operation and/or irreversible damage to the EVM. If there are questions concerning the input range, please contact a TI field representative prior to connecting the input power.

Applying loads outside of the specified output range may result in unintended operation and/or possible permanent damage to the EVM. Please consult the EVM User's Guide prior to connecting any load to the EVM output. If there is uncertainty as to the load specification, please contact a TI field representative.

During normal operation, some circuit components may have case temperatures greater than 85 = C. The EVM is designed to operate properly with certain components above 85 = C as long as the input and output ranges are maintained. These components include but are not limited to linear regulators, switching transistors, pass transistors, and current sense resistors. These types of devices can be identified using the EVM schematic located in the EVM User's Guide. When placing measurement probes near these devices during operation, please be aware that these devices may be very warm to the touch.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
THS4520RGTR	ACTIVE	VQFN	RGT	16	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	4520	<a href="#">Samples</a>
THS4520RGTRG4	ACTIVE	VQFN	RGT	16	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	4520	<a href="#">Samples</a>
THS4520RGTT	ACTIVE	VQFN	RGT	16	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	4520	<a href="#">Samples</a>
THS4520RGTTG4	ACTIVE	VQFN	RGT	16	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	4520	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

### QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
THS4520RGTR	VQFN	RGT	16	3000	330.0	12.4	3.3	3.3	1.1	8.0	12.0	Q2

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
