

TDA8432

Computer-Controlled Deflection Processor for Video Displays

Objective Specification

Linear Products

DESCRIPTION

The TDA8432 is an I²C bus-controlled deflection processor (analog picture geometry processor) which contains the control and drive functions of the deflection circuits in a computer-controlled TV (CCTV) or monitor. This IC replaces all picture geometry settings which are performed manually during manufacturing. The alignment of 10 picture geometry parameters for the vertical and horizontal deflection is accomplished by means of a microcontroller via the I²C bus. Furthermore, it eliminates the external components needed for adjusting the horizontal frequency and phase position, vertical linearity, picture height, east-west parabola, and picture width. The east-west shaping circuit is also eliminated. Provisions have been incorporated to make several sync processor (TDA2579 and TDA2595) functions I²C bus-controllable.

FEATURES

- I²C bus interface for all functions
- Input for vertical sync from sync processor
- Vertical sawtooth generator with frequency-independent amplitude
- Vertical output stage with feedback input for driving a vertical deflection amplifier
- East-west raster correction drive output
- EHT modulation input, providing optimum picture geometry compensation for static and dynamic EHT load variations
- I²C bus-controlled alignment of 10 deflection parameters
- Provisions for controlling a sync processing IC which does not have an I²C bus interface, including:
 - Two digital-to-analog converters for alignment of the free-running horizontal frequency and horizontal phase position
 - An I/O pin enabling computer alignment of the free-running horizontal frequency
 - A special purpose 4-level output for time constant switching of the horizontal phase-locked loop
 - A special purpose 3-level input for detection of the mute function and the 50Hz/60Hz state of the sync processor
- A switchable output (e.g., for controlling a video source selector)

APPLICATIONS

- Video monitors
- Color TV receivers

NOTES:

1. The Pins 2, 5, 11, 12, 13, 14 withstand the ESD test.
2. Measured with an input circuit for optimum noise figure.
3. The values have been corrected for hybrid and cable losses. The symmetrical output impedance of the hybrid is 100Ω .
4. The input level of an $N + 5 - 1\text{MHz}$ signal which is just visible (Amtsblatt 69).
5. The gain is defined as the transducer gain measured in Figure 1 + the voltage transformation ratio of L6-L7. The ratio is 6:1 (16dB).
6. All S parameters are referred to a 50Ω system.
