1 Device Overview

1.1 Features

- Supply Voltage Range 2.2 V to 3.6 V
- 16-Bit RISC Architecture, up to 16.384-MHz System Clock
- Power Consumption
 - Active Mode (AM):
All System Clocks Active
275 μ A/MHz at 16.384-MHz, 3.0 V, Flash Program Execution (Typical)
 - Standby Mode (LPM3):
Watchdog Timer Active, Full RAM Retention
210 μ A at 3.0 V (Typical)
 - Off Mode (LPM4):
Full RAM Retention
70 μ A at 3.0 V (Typical)
 - Shutdown Mode (LPM4.5):
75 nA at 3.0 V (Typical)
- Wake up From Standby Mode in 1 μ s
- Memories
 - Up to 32KB of Flash Main Memory
 - 1KB of Flash Information Memory
 - Up to of 2KB of RAM
- Power Management System
 - Integrated LDO With 1.8-V Regulated Core Supply Voltage
 - Supply Voltage Monitor With Programmable Level Detection
 - Brownout Detector
 - Built-in Voltage Reference
 - Temperature Sensor
- Clock System
 - 16.384-MHz Internal Digitally Controlled Oscillator (DCO)
 - DCO Operation With Internal or External Resistor
 - External Digital Clock Source
- Up to Four 24-Bit Sigma-Delta Analog-to-Digital Converters (ADCs) With Differential PGA Inputs
- Two 16-Bit Timers With Three Capture/Compare Registers Each
- Enhanced Universal Serial Communication Interfaces (eUSCIs)
 - eUSCI_A0
 - Enhanced UART With Automatic Baud-Rate Detection
 - IrDA Encoder and Decoder
 - Synchronous SPI
 - eUSCI_B0
 - Synchronous SPI
 - I²C
- 16-Bit Hardware Multiplier
- Serial Onboard Programming, No External Programming Voltage Needed
- Programmable Code Protection
- On-Chip Emulation Module
- [Device Comparison](#) Summarizes the Available Family Members
- Available in 28-Pin TSSOP (PW) and 32-Pin VQFN (RHB) Packages
- For Complete Module Descriptions, See the [MSP430i2xx Family User's Guide](#)

1.2 Applications

- Metering
- Submetering
- Power Monitoring and Control
- Industrial Sensors
- 1-Phase AC and DC Power Monitoring
- 2-Phase Electronic Meters
- Smart Plugs
- Smart Power Strips
- Medical – Multiple-Parameter Patient Monitoring

1.3 Description

The MSP430i204x, MSP430i203x, and MSP430i202x devices consist of a powerful 16-bit RISC CPU, a DCO-based clock system that generates system clocks, a power-management module (PMM) with built-in voltage reference and voltage monitor, two to four 24-bit sigma-delta ADCs, a temperature sensor, a 16-bit hardware multiplier, two 16-bit timers, one eUSCI-A module and one eUSCI-B module, a watchdog timer (WDT), and up to 16 I/O pins.

2 Revision History

Changes from August 15, 2014 to May 2, 2018

Page

• Changed the list of applications in Section 1.2	1
• Added Section 3.1 , <i>Related Products</i>	4
• Added typical conditions statements at the beginning of Section 5 , <i>Specifications</i>	14
• Added SD24_B input pins and AUXVCCx pins to exception list on "Voltage applied to pins" parameter, and added SD24_B input pin limits in "Diode current at pins" parameter in Section 5.1 , <i>Absolute Maximum Ratings</i>	14
• Moved T_{stg} to Section 5.1 , <i>Absolute Maximum Ratings</i>	14
• Added Section 5.2 , <i>ESD Ratings</i>	14
• Added Section 5.6 , <i>Thermal Resistance Characteristics</i>	17
• Changed the MAX value of the $t_{WAKE-UP-LPM4}$ parameter from 35 μ s to 45 μ s in Table 5-6 , <i>Wake-up Times From Low Power Modes</i>	19
• Added the CAUTION that begins "The CPU will lock up if..." in Section 6.3 , <i>CPU</i>	40
• Updated Section 8 , <i>Device and Documentation Support</i> , with device-specific information and links	65

A3.0+	7	7	I	SD24 positive analog input A3.0 ⁽³⁾⁽⁴⁾⁽⁵⁾
A3.0-	8	8	I	SD24 negative analog input A3.0 ⁽³⁾⁽⁴⁾⁽⁵⁾
VREF ⁽⁶⁾	9	9	I	SD24 external reference voltage input
AVSS	10	10		Analog supply voltage, negative terminal
ROSC	11	11		External resistor pin for DCO. Connect recommended resistor between ROSC and AVSS for DCO operation in external resistor mode. Connect ROSC to AVSS while operating DCO in internal resistor mode.
DVSS	12	12		Digital supply voltage, negative terminal
VCC	13	13		Analog and digital supply voltage, positive terminal
VCORE ⁽⁷⁾	14	14		Regulated core power supply (internal use only, no external current loading)
$\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$	15	15	I/O	Reset or nonmaskable interrupt input. Spy-Bi-Wire test data input/output for device programming and test.
TEST/SBWTCK	16	16	I	Selects test mode for JTAG pins on P1.0 to P1.3. Spy-Bi-Wire test clock input for device programming and test.
P1.0/UCA0STE/MCLK/TCK	17	17	I/O	General-purpose digital I/O pin. eUSCI_A0 SPI slave transmit enable (direction controlled by eUSCI). MCLK output. JTAG test clock. TCK is the clock input port for device programming and test.
P1.1/UCA0CLK/SMCLK/TMS	18	18	I/O	General-purpose digital I/O pin. eUSCI_A0 clock input/output (direction controlled by eUSCI). SMCLK output. JTAG test mode select. TMS is used as an input port for device programming and test.
P1.2/UCA0RXD/UCA0SOMI/ ACLK/TDI/TCLK	19	19	I/O	General-purpose digital I/O pin. eUSCI_A0 UART receive data or eUSCI_A0 SPI slave out/master in (direction controlled by eUSCI). ACLK output. JTAG test data input or test clock input for device programming and test.

(1) I = input, O = output

(2) N/A = not available

(3) Short unused analog input pairs and connect them to analog ground (see Section 4.4 for recommendations on all unused pins).

(4) Not available on MSP430i2021 and MSP430i2020 devices.

(5) Not available on MSP430i2031 and MSP430i2030 devices.

(6) When the SD24 operates with the internal reference (SD24REFS = 1), the VREF pin must not be loaded externally. Connect only the recommended capacitor value (C_{VREF}) from the VREF pin to AVSS (see Table 5-19).

(7) VCORE is for internal use only. No external current loading is possible. Connect VCORE to only the recommended capacitor value (C_{VCORE}) (see Section 5.3).

Table 4-1. Signal Descriptions (continued)

TERMINAL			I/O ⁽¹⁾	DESCRIPTION
NAME	NO. ⁽²⁾			
	PW	RHB		
P1.3/UCA0TXD/UCA0SIMO/ TA0CLK/TDO/TDI	20	20	I/O	General-purpose digital I/O pin. eUSCI_A0 UART transmit data or eUSCI_A0 SPI slave in/master out (direction controlled by eUSCI). Timer external clock input TACLK for TA0. JTAG test data output port. TDO/TDI data output or programming data input terminal.
P1.4/UCB0STE/TA0.0	21	21	I/O	General-purpose digital I/O pin. eUSCI_B0 SPI slave transmit enable (direction controlled by eUSCI). Timer TA0 CCR0 capture: CCI0A input, compare: Out0 output.
P1.5/UCB0CLK/TA0.1	22	22	I/O	General-purpose digital I/O pin. eUSCI_B0 clock input/output (direction controlled by eUSCI). Timer TA0 CCR1 capture: CCI1A input, compare: Out1 output.
P1.6/UCB0SCL/UCB0SOMI/ TA0.2	23	23	I/O	General-purpose digital I/O pin. eUSCI_B0 I ² C clock or eUSCI_B0 SPI slave out/master in (direction controlled by eUSCI). Timer TA0 CCR2 capture: CCI2A input, compare: Out2 output.
P1.7/UCB0SDA/UCB0SIMO/ TA1CLK	24	24	I/O	General-purpose digital I/O pin. eUSCI_B0 I ² C data or eUSCI_B0 slave input/master output (direction controlled by eUSCI). Timer external clock input TACLK for TA1.
P2.0/TA1.0/CLKIN	25	25	I/O	General-purpose digital I/O pin. Timer TA1 CCR0 capture: CCI0A input, compare: Out0 output. DCO bypass clock input.
P2.1/TA1.1	26	26	I/O	General-purpose digital I/O pin. Timer TA1 CCR1 capture: CCI1A input, compare: Out1 output.
P2.2/TA1.2	27	27	I/O	General-purpose digital I/O pin. Timer TA1 CCR2 capture: CCI2A input, compare: Out2 output.
P2.3/VMONIN	28	28	I/O	General-purpose digital I/O pin. Voltage monitor input.
P2.4/TA1.0 ⁽⁸⁾	N/A	29	I/O	General-purpose digital I/O pin. Timer TA1 CCR0 capture: CCI0B input, compare: Out0 output.
P2.5/TA0.0 ⁽⁸⁾	N/A	30	I/O	General-purpose digital I/O pin. Timer TA0 CCR0 capture: CCI0B input, compare: Out0 output.
P2.6/TA0.1 ⁽⁸⁾	N/A	31	I/O	General-purpose digital I/O pin. Timer TA0 CCR1 compare: Out1 output.
P2.7/TA0.2 ⁽⁸⁾	N/A	32	I/O	General-purpose digital I/O pin. Timer TA0 CCR2 compare: Out2 output.

(8) These pins are not available on the 28-pin PW package. Program these four pins to output direction and drive value 0 in software.

4.3 Pin Multiplexing

Pin multiplexing for these devices is controlled by both register settings and operating modes (for example, if the device is in test mode). For details of the settings for each pin and schematics of the multiplexed ports, see [Section 6.11](#).

4.4 Connection of Unused Pins

Table 4-2 lists the correct termination of all unused pins.

Table 4-2. Connection of Unused Pins⁽¹⁾

PIN	POTENTIAL	COMMENT
AVCC	DVCC	
AVSS	DVSS	
VREF	Open	
ROSC	AVSS	Connect ROSC pin to AVSS when DCO is used in internal resistor mode
Px.0 to Px.7	Open	Switched to port function, output direction
Ax.0+ and Ax.0-	AVSS	Short unused analog input pairs and connect them to analog ground
$\overline{\text{RST}}/\text{NMI}$	DVCC or VCC	47-k Ω pullup with 10 nF (or 2.2 nF ⁽²⁾) pulldown
TEST	Open	This pin always has an internal pulldown enabled
P1.3/TDO P1.2/TDI P1.1/TMS P1.0/TCK	Open	The JTAG pins are shared with general-purpose I/O function (P1.x). If not being used, these should be switched to port function, output direction. When used as JTAG pins, these pins should remain open.

- (1) Any unused pin with a secondary function that is shared with general-purpose I/O should follow the Px.0 to Px.7 unused pin connection guidelines.
- (2) The pulldown capacitor should not exceed 2.2 nF when using devices with Spy-Bi-Wire interface in Spy-Bi-Wire mode or in 4-wire JTAG mode with TI tools like FET interfaces or GANG programmers.

5 Specifications

All graphs in this section are for typical conditions, unless otherwise noted.

Typical (TYP) values are specified at $V_{CC} = 3.3\text{ V}$ and $T_A = 25^\circ\text{C}$, unless otherwise noted.

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

		MIN	MAX	UNIT
Supply voltage applied at VCC		-0.3	4.1	V
Voltage applied to pins	All pins except VCORE ⁽³⁾ , ROSC ⁽⁴⁾ , and SD24 input pins (A0.0+, A0.0-, A1.0+, A1.0-, A2.0+, A2.0-, A3.0+, A3.0-) ⁽⁵⁾	-0.3	$V_{CC} + 0.3$	V
Diode current at pins	All pins except SD24 input pins (A0.0+, A0.0-, A1.0+, A1.0-, A2.0+, A2.0-, A3.0+, A3.0-)		±2	mA
	A0.0+, A0.0-, A1.0+, A1.0-, A2.0+, A2.0-, A3.0+, A3.0- ⁽⁶⁾		2	
Maximum junction temperature, $T_{J,MAX}$			115	°C
Storage temperature, T_{stg} ⁽⁷⁾		-55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are referenced to V_{SS} .
- (3) VCORE is for internal device use only. Do not apply external DC loading or voltage at VCORE.
- (4) Do not apply external DC loading or voltage at ROSC. Connect the recommended resistor at ROSC using the DCO in external resistor mode. Connect ROSC to AVSS when operating the DCO in internal resistor mode.
- (5) See [Table 5-18](#) for SD24_B specifications.
- (6) A protection diode is connected to V_{CC} for the SD24 input pins. No protection diode is connected to V_{SS} .
- (7) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

5.2 ESD Ratings

over operating free-air temperature range (unless otherwise noted)

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±1000 V may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±250 V may actually have higher performance.

5.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage during program execution and flash programming or erase ($V_{CC} = V_{CC}$)	2.2		3.6	V
V_{SS}	Supply voltage ($AVSS = DVSS = V_{SS}$)		0		V
T_A	Operating free-air temperature	T temperature range		105	°C
T_J	Operating junction temperature	T temperature range		105	°C
C_{VCORE}	Recommended capacitor at VCORE		470		nF
$\frac{C_{VCC}}{C_{VCORE}}$	Capacitor ratio of VCC to VCORE	10			
f_{SYSTEM}	Processor frequency (maximum MCLK frequency) ⁽¹⁾⁽²⁾	0		16.384	MHz

- (1) The MSP430i CPU is clocked directly with MCLK.
- (2) Modules may have a different maximum input clock specification. See the specification of the respective module in this data sheet.

V _I	Absolute input voltage range			AV _{SS} – 1		V _{CC}	V
V _{IC}	Common-mode input voltage range			AV _{SS} – 1		V _{CC}	V

(1) All parameters pertain to each SD24 channel.

(2) The full-scale range is defined by V_{FSR+} = +V_{REF}/GAIN and V_{FSR-} = -V_{REF}/GAIN; FSR = V_{FSR+} – V_{FSR-} = 2xV_{REF}/GAIN. If VREF is sourced externally, the analog input range should not exceed 80% of V_{FSR+} or V_{FSR-}; that is, V_{ID} = 0.8 V_{FSR-} to 0.8 V_{FSR+}. If VREF is sourced internally, the given V_{ID} ranges apply.

(3) Applicable for SD24 modulator OFF as well as ON conditions.

6.3 CPU

The MSP430i CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock.

Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator respectively. The remaining registers are general-purpose registers (see [Figure 6-7](#)).

Peripherals are connected to the CPU using data, address, and control buses and can be handled with all instructions.

Figure 6-7. CPU Registers

CAUTION

The CPU will lock up if the device enters a low-power mode (CPU off) within 64 cycles after reset.

6.4 Instruction Set

The instruction set consists of 51 instructions with three formats and seven address modes. Each instruction can operate on word and byte data. [Table 6-1](#) gives examples of the three types of instruction formats; [Table 6-2](#) lists the address modes.

Table 6-1. Instruction Word Formats

6.5 Operating Modes

MSP430i204x, MSP430i203x, MSP430i202x devices have one active mode and four software-selectable low-power modes. An interrupt event can wake up the device from the low-power modes LPM0 to LPM4, service the request, and restore back to the low-power mode on return from the interrupt program.

The following five operating modes can be configured by software:

- Active mode (AM)
 - All clocks are active.
- Low-power mode 0/1 (LPM0 = LPM1)
 - CPU is disabled
 - Internal regulator remains enabled
 - DCO remains enabled
 - MCLK is disabled
 - ACLK and SMCLK remain active
- Low-power mode 2/3 (LPM2 = LPM3)
 - CPU is disabled
 - Internal regulator remains enabled
 - DCO remains enabled
 - MCLK and SMCLK are disabled
 - ACLK remains active
- Low-power mode 4 (LPM4)
 - CPU is disabled
 - Internal regulator remains enabled
 - DCO is disabled
 - MCLK, SMCLK, and ACLK are disabled
- Low-power mode 4.5 (LPM4.5)
 - Internal regulator is disabled
 - No RAM retention
 - I/O pad state retention
 - Wake from $\overline{\text{RST}}$ /NMI, ports pins P2.1 or P2.2

6.6 Interrupt Vector Addresses

The interrupt vectors and the power-up starting address are in the address range 0FFFFh to 0FFE0h. The vector contains the 16-bit address of the appropriate interrupt handler instruction sequence.

If the reset vector (located at address 0FFFEh) contains 0FFFFh (for example, flash is not programmed), the CPU goes into LPM4 immediately after power up.

Table 6-3. Interrupt Vector Addresses

			0FFE4h	2
I/O Port P2	P2IFG.0 to P2IFG.7 ⁽²⁾⁽⁴⁾	Maskable	0FFE2h	1
			0FFE0h	0, lowest

(1) A reset is generated if the CPU tries to fetch instructions from within the module register memory address range (0h to 01FFh) or from within unused address range.

(2) Multiple source flags

(3) (Non)maskable: the individual interrupt-enable bit can disable an interrupt event, but the general interrupt enable cannot.

(4) Interrupt flags are in the module.

6.7 Special Function Registers

Some interrupt enable and interrupt flag bits are collected into the lowest address space. Special function register bits not allocated to a functional purpose are not physically present in the device. Simple software access is provided with this arrangement.

Legend

rw	Bit can be read and written.
rw-0, rw-1	Bit can be read and written. It is Reset or Set by PUC.
rw-(0), rw-(1)	Bit can be read and written. It is Reset or Set by POR.
rw-[0], rw-[1]	Bit can be read and written. It is Reset or Set by BOR.
	SFR bit is not present in device.

WDTIFG	Set on watchdog timer overflow (in watchdog mode) or security key violation. Reset on V _{CC} power-up or a reset condition at RST/NMI pin in reset mode.
OFIFG	Flag set on oscillator fault. This flag can be cleared by software when the oscillator runs free of fault.
BORIFG	Brown out reset flag. This bit is set after V _{CC} power up and can be cleared by software.
RSTIFG	External reset interrupt flag. Set on a reset condition at RST/NMI pin in reset mode. Reset on V _{CC} power up.
NMIIFG	Set by the RST/NMI pin in NMI configuration.

6.8 Flash Memory

The flash memory can be programmed through the Spy-Bi-Wire or JTAG port, or in-system by the CPU. The CPU can perform single-byte and single-word writes to the flash memory. Features of the flash memory:

- Flash memory has n segments of main memory and one segment of information memory.
- Segment size is 1KB for both main memory and information memory.
- Segments 0 to n in main memory can be erased in one step, or each segment may be individually erased.
- Information memory segment can be erased separately or as a group with main memory segments 0 to n.
- Information memory segment contains calibration data. After reset, information memory segment is protected against programming and erasing. It can be unlocked but care should be taken not to erase this segment if the device-specific calibration data is required.

6.9 JTAG Operation

6.9.1 JTAG Standard Interface

The MSP430i family supports the standard JTAG interface which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/O. The TEST/SBWTCK pin is used to enable the JTAG signals. In addition to these signals, the $\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$ is required to interface with MSP430i development tools and device programmers. [Table 6-6](#) lists the JTAG pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#).

Table 6-6. JTAG Pin Requirements and Functions

DEVICE SIGNAL	DIRECTION	FUNCTION

DVSS		Ground supply

6.9.2 Spy-Bi-Wire Interface

In addition to the standard JTAG interface, the MSP430i family supports the 2-wire Spy-Bi-Wire interface. Spy-Bi-Wire can be used to interface with MSP430i development tools and device programmers. [Table 6-7](#) lists the Spy-Bi-Wire interface pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#).

$\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$	IN, OUT	Spy-Bi-Wire data input/output
VCC		Power supply
DVSS		Ground supply

6.9.3 JTAG Disable Register

The SYSJTAGDIS register can disable the JTAG port to provide code protection and device security. JTAG is disabled when software writes the value 0xA5A5 to this register within 64 MCLK clock cycles after a BOR or POR reset; otherwise, the JTAG port is enabled. Any writes to this register after the first 64 MCLK clock cycles are ignored. Reads from this register at any time return the JTAG enable or disable status. The value 0xA5A5 indicates that JTAG is disabled, and 0x9696 indicates that JTAG is enabled. The SYSJTAGDIS register is mapped to address 01FEh.

NOTE

Application programming the device to any of the low power modes within first 64 MCLK clock cycles after a BOR or POR reset will lock the device for any JTAG/SBW access.

Table 6-8. SYSJTAGDIS Register

rw-[1]	rw-[0]	rw-[1]	rw-[0]	rw-[0]	rw-[1]	rw-[0]	rw-[1]

JTAGKEY 0xA5A5 indicates JTAG is disabled and 0x9696 indicates JTAG is enabled.

6.10 Peripherals

Peripherals are connected to the CPU through data, address, and control buses. The peripherals can be managed using all instructions. For complete module descriptions, see the [MSP430i Family User's Guide](#).

6.10.1 Clock System

The clock system consists of a fixed 16.384-MHz frequency internal DCO. The DCO can operate in internal resistor mode or external resistor mode. The DCO clock accuracy is higher when operating in external resistor mode especially upon variation in operating temperature. This feature can be useful in applications like utility metering in which accurate clock is necessary under varying operating temperature. When external resistor mode is selected by application, the resistor of recommended value must be connected to ROSC pin of the device. Refer to [Table 5-2](#) for the recommended value of resistor at ROSC pin. TI recommends connecting the ROSC pin to AVSS while operating DCO in internal resistor mode. When a resistor fault is detected in the external resistor mode, the DCO automatically switches to the internal resistor mode as a fail-safe mechanism to keep the system clocks active.

The DCO can be completely bypassed and the system clocks can be sourced by external digital clock. The clock system generates MCLK, SMCLK, and ACLK. MCLK is used by the CPU, while SMCLK and ACLK are used by the peripheral modules. There are programmable clock dividers for MCLK and SMCLK. ACLK runs at a fixed 32-kHz frequency. The clock system supports active mode and four low-power modes.

6.10.2 Power-Management Module (PMM)

The PMM consists of voltage regulator that generates 1.8-V regulated core voltage. There is a brownout reset (BOR) circuit on the high-voltage domain, and a supply voltage supervisor (SVS) module on the low-voltage domain. The BOR and SVS provide the proper internal reset signal to the device during power-on and power-off.

A built-in voltage reference is used by submodules of the PMM and by the analog modules on the device. A temperature sensor is also available within the built-in voltage reference.

The voltage monitor (VMON) on the high-voltage domain can monitor external voltage on the VMONIN pin against the internal reference voltage or by comparing the on-chip V_{CC} to one of three programmable threshold voltages. During the LPM4.5 mode, the reference, voltage regulator, temperature sensor, and voltage monitor are turned off, and only the high-side brownout circuit is active.

6.10.3 Digital I/O

Two 8-bit I/O ports (P1 and P2) are implemented on the MSP430i204x, MSP430i203x, MSP430i202x devices. On 32-pin RHB devices, ports P1 and P2 are complete, and 16 I/Os are available. On 28-pin PW devices, port P2 is reduced to 4 bits, and 12 I/Os are available. On 28-pin PW devices, the unavailable pins (P2.4 to P2.7) must be programmed to port function, output direction, and be driven with value 0.

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt condition is possible.
- Edge-selectable interrupt input capability for all 8 bits of port P1 and P2
- LPM4.5 wake-up capability for Port pins P2.1 and P2.2
- Read and write access to port-control registers is supported by all instructions.

6.10.4 Watchdog Timer (WDT)

The primary function of the WDT module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be disabled or configured as an interval timer and can generate interrupts at selected time intervals.

6.10.5 Timer TA0

Timer TA0 is a 16-bit timer/counter (Timer_A type) with three capture/compare registers. TA0 can support multiple capture/compares, PWM outputs, and interval timing (see [Table 6-9](#)). TA0 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

6.10.6 Timer TA1

Timer TA1 is a 16-bit timer/counter (Timer_A type) with three capture/compare registers. TA1 can support multiple capture/compares, PWM outputs, and interval timing (see [Table 6-10](#)). TA1 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

6.10.7 Enhanced Universal Serial Communication Interface (eUSCI)

The eUSCI module is used for serial data communication. The eUSCI module supports synchronous communication protocols such as SPI (3-pin or 4-pin) and I²C, and asynchronous communication protocols such as UART, enhanced UART with automatic baudrate detection, and IrDA.

The eUSCI_An module provides support for SPI (3-pin or 4-pin), UART, enhanced UART, and IrDA.

The eUSCI_Bn module provides support for SPI (3-pin or 4-pin) and I²C.

One eUSCI_A and one eUSCI_B module are implemented on MSP430i20xx devices.

6.10.8 Hardware Multiplier

The multiplication operation is supported by a dedicated peripheral module. The module performs 16×16-bit, 16×8-bit, 8×16-bit, and 8×8-bit operations. The module supports signed and unsigned multiplication as well as signed and unsigned multiply-and-accumulate operations. The result of an operation can be accessed immediately after the operands have been loaded into the peripheral registers. No additional clock cycles are required.

6.10.9 SD24

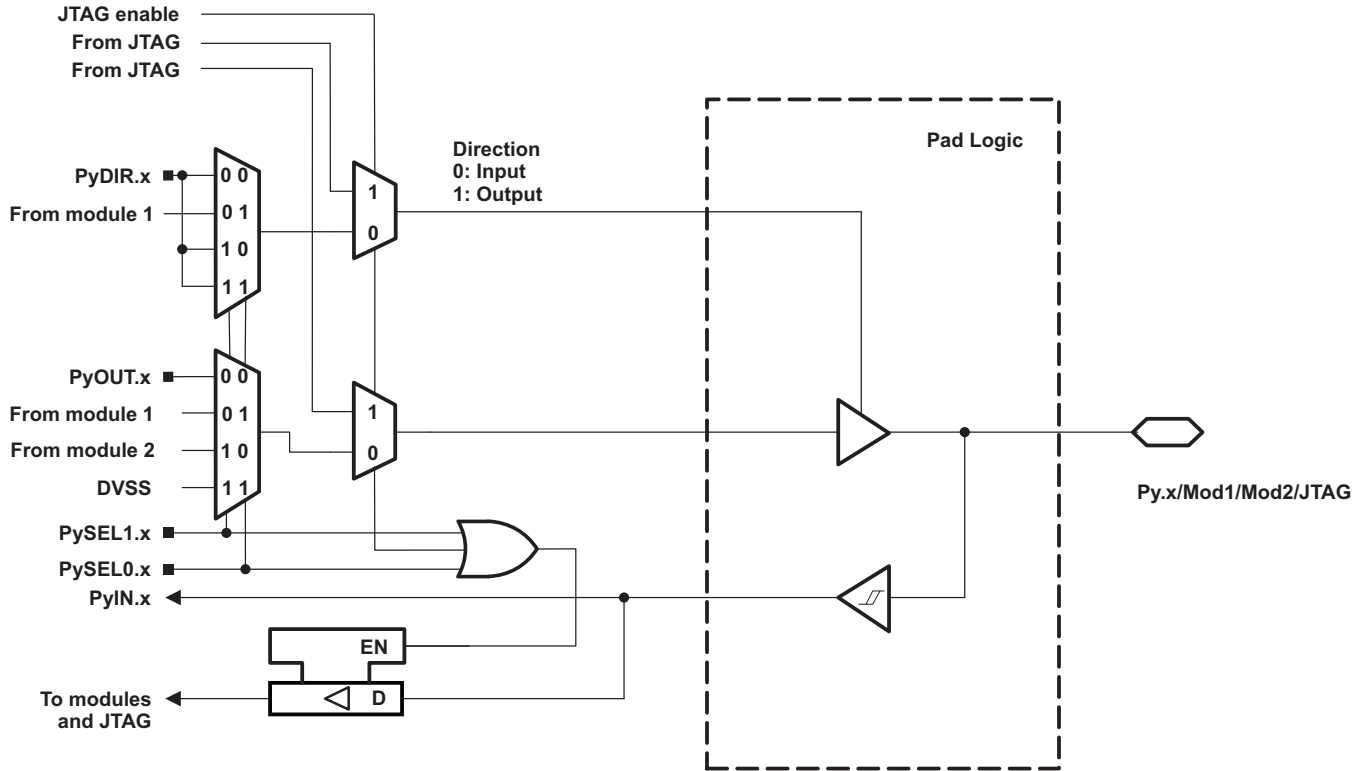

There are up to four independent 24-bit sigma-delta ADCs. Each converter is designed with a fully differential analog input pair and programmable gain amplifier input stage. Also the converters are based on second-order oversampling sigma-delta modulators and digital decimation filters. The decimation filters are comb-type filters with selectable oversampling ratios of up to 256.

The SD24 converters can operate with internal reference (SD24REFS = 1) or with external reference (SD24REFS = 0). When SD24 operates with internal reference the VREF pin must not be loaded externally. Connect only the recommended capacitor value (C_{VREF}) at VREF pin to AVSS (see [Table 5-19](#)).

6.14 Identification

6.14.1 Device Identification

The device type can be identified from the top-side marking on the device package. See the [packaging information page](#) for help.

6.14.2 JTAG Identification

Programming through the JTAG interface, including reading and identifying the JTAG ID, is described in detail in the [MSP430 Programming With the JTAG Interface](#).

7 Applications, Implementation, and Layout

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

The following resources provide application guidelines and best practices when designing with the MSP430i20xx devices.

Implementation of a One- or Two-Phase Electronic Watt-Hour Meter Using MSP430i20xx

This application report describes the implementation of a low-cost 1- or 2-phase electronic electricity meter that uses the TI MSP430i20xx metering processor. This application report includes the necessary information with regard to metrology software and hardware procedures for this single-chip implementation.

Single-Phase and DC Embedded Metering Power Using MSP430i2040

This report describes an EVM design that uses the MSP430i2040 microcontroller in the application of embedded metering (submetering). In this application space, the electricity measuring device is embedded in the end application and provides the user with information about the voltage, current, and power consumption of the device. In addition, the EVM can compensate for the line resistance and EMI filter capacitance.

Single-Phase AC and DC Power Monitor With Wire Resistance and EMI Capacitor Compensation

This reference design shows the application of a single-phase AC and DC power monitor (server power monitor) using the MSP430i2040 microcontroller.

Hardware Features

- Spy-Bi-Wire debugging interface
- 14-pin debugger connector allows direct interface to MSP-FET430UIF without the need for an adaptor
- Built-in switching mode power supply that can be supplied by 85 to 265 VAC (47 Hz to 63 Hz) or 120 to 380 VDC simplifies evaluation setup
- Built-in RS232 external communication interface for reading measurements and performing calibration
- Seven built-in LEDs for customer debugging and visual monitoring

Software Features

- Measurement of root mean square voltage, root mean square current, active power, reactive power, apparent power, power factor, AC frequency, voltage THD, current THD, fundamental voltage, fundamental current, and fundamental active power
- Readings update every four AC cycles or every 80 ms in case of DC input
- Can measure AC and DC
- Can switch between AC and DC measurement mode automatically
- Can compensate for EMI filter capacitor and wire resistance
- No separate DC calibration required

Three-Outlet Smart Power Strip

This reference design shows the application of a 3-socket power strip with power consumption measuring capability using the MSP430i2040 microcontroller.

Features

- Measures individual power and current of three socket outlets
- Built-in relay for further functionality expansion:
 - Switch off an output based on user current limit setting
 - Switch on or off an output based on user set master current trigger level
- Supports latched and nonlatched relay
- Built-in power supply and debugging interface
- Onboard connector to external communication modules:
 - Isolated serial (on first version)

8 Device and Documentation Support

8.1 Getting Started and Next Steps

For more information on the MSP430™ family of devices and the tools and libraries that are available to help with your development, visit the [Getting Started page](#).

8.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices. Each MSP MCU commercial family member has one of two prefixes: MSP or XMS. These prefixes represent evolutionary stages of product development from engineering prototypes (XMS) through fully qualified production devices (MSP).

XMS – Experimental device that is not necessarily representative of the final device's electrical specifications

MSP – Fully qualified production device

XMS devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format. [Figure 8-1](#) provides a legend for reading the complete device name.

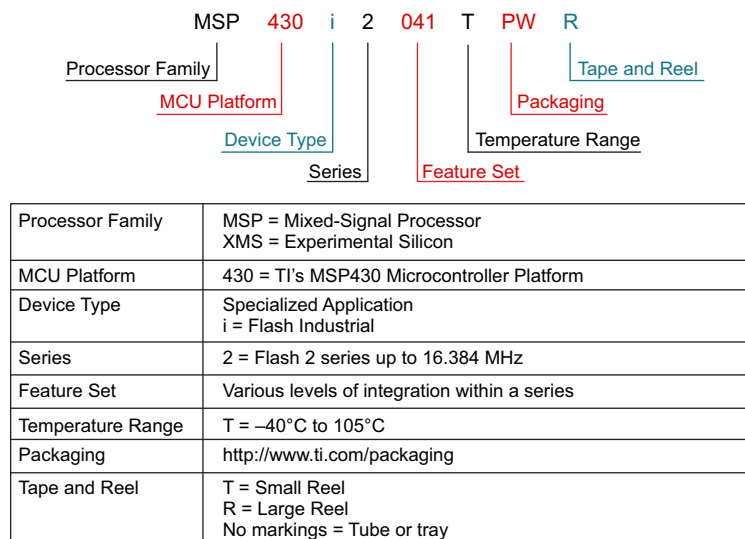

Figure 8-1. Device Nomenclature

8.3 Tools and Software

All MSP microcontrollers are supported by a wide variety of software and hardware development tools. Tools are available from TI and various third parties. See them all at [Development Kits and Software for Low-Power MCUs](#).

Design Kits and Evaluation Modules

32-pin Target Development Board and MSP-FET Programmer Bundle for MSP430i2x MCUs The MSP-FET430U32A is a stand-alone ZIF socket target board used to program and debug the MSP430 MCU in-system through the JTAG interface or the Spy-Bi-Wire (2-wire JTAG) protocol.

MSP430 LaunchPad™ Value Line Development Kit The MSP-EXP430G2 LaunchPad development kit is an easy-to-use microcontroller development board for the low-power and low-cost MSP430G2x MCUs. It has on-board emulation for programming and debugging and features a 14/20-pin DIP socket, on-board buttons and LEDs and BoosterPack plug-in module pinouts that support a wide range of modules for added functionality such as wireless, displays, and more.

MSP430i2040 Submetering EVM This embedded metering (sub-meter or e-meter) EVM is designed based on the MSP430i2040. The EVM can be connected to the mains (or to DC) and the load directly. The EVM measures the electrical parameters of the load and the result of measurement can be read from the UART port. This EVM provided with built-in power supply and isolated serial connect to facilitate user quick start to the evaluation of the MSP430i2040 in embedded metering application.

Software

MSP430Ware™ Software MSP430Ware software is a collection of code examples, data sheets, and other design resources for all MSP430 devices delivered in a convenient package. In addition to providing a complete collection of existing MSP430 MCU design resources, MSP430Ware software also includes a high-level API called MSP Driver Library. This library makes it easy to program MSP430 hardware. MSP430Ware software is available as a component of CCS or as a stand-alone package.

MSP430i20xx Code Examples C code examples are available for every MSP device that configures each of the integrated peripherals for various application needs.

Floating Point Math Library for MSP430 Leveraging the intelligent peripherals of TI devices, this floating point math library of scalar functions brings you up to 26x better performance. Mathlib is easy to integrate into your designs. This library is free and is integrated in both Code Composer Studio and IAR IDEs.

Fixed Point Math Library for MSP The TI MSP IQmath and Qmath Libraries are a collection of highly optimized and high-precision mathematical functions for C programmers to seamlessly port a floating-point algorithm into fixed-point code on MSP430 and MSP432 devices. These routines are typically used in computationally intensive real-time applications where optimal execution speed, high accuracy and ultra-low energy are critical. By using the IQmath and Qmath libraries, it is possible to achieve execution speeds considerably faster and energy consumption considerably lower than equivalent code written using floating-point math.

Development Tools

Code Composer Studio™ Integrated Development Environment for MSP Microcontrollers Code Composer Studio (CCS) integrated development environment (IDE) supports all MSP microcontroller devices. CCS comprises a suite of embedded software utilities used to develop and debug embedded applications. CCS includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features.

MSP Flasher - Command Line Programmer MSP Flasher is an open-source shell-based interface for programming MSP microcontrollers through a FET programmer or eZ430 using JTAG or Spy-Bi-Wire (SBW) communication. MSP Flasher can download binary files (.txt or .hex) directly to the MSP microcontroller without an IDE.

MSP MCU Programmer and Debugger The MSP-FET is a powerful emulation development tool – often called a debug probe – which lets users quickly begin application development on MSP low-power MCUs. Creating MCU software usually requires downloading the resulting binary program to the MSP device for validation and debugging.

MSP-GANG Production Programmer The MSP Gang Programmer is an MSP430 or MSP432 device programmer that can program up to eight identical MSP430 or MSP432 flash or FRAM devices at the same time. The MSP Gang Programmer connects to a host PC using a standard RS-232 or USB connection and provides flexible programming options that let the user fully customize the process.

8.4 Documentation Support

The following documents describe the MSP430i20xx MCUs. Copies of these documents are available on the Internet at www.ti.com.

Receiving Notification of Document Updates

To receive notification of documentation updates—including silicon errata—go to the product folder for your device on ti.com (for links to product folders, see [Section 8.5](#)). In the upper right corner, click the "Alert me" button. This registers you to receive a weekly digest of product information that has changed (if any). For change details, check the revision history of any revised document.

User's Guides

MSP430i2xx Family User's Guide Detailed description of all modules and peripherals available in this device family.

MSP430™ Flash Device Bootloader (BSL) User's Guide The MSP430 bootloader (BSL) lets users communicate with embedded memory in the MSP430 microcontroller during the prototyping phase, final production, and in service. Both the programmable memory (flash memory) and the data memory (RAM) can be modified as required. Do not confuse the bootloader with the bootstrap loader programs found in some digital signal processors (DSPs) that automatically load program code (and data) from external memory to the internal memory of the DSP.

MSP430 Programming With the JTAG Interface This document describes the functions that are required to erase, program, and verify the memory module of the MSP430 flash-based and FRAM-based microcontroller families using the JTAG communication port. In addition, it describes how to program the JTAG access security fuse that is available on all MSP430 devices. This document describes device access using both the standard 4-wire JTAG interface and the 2-wire JTAG interface, which is also referred to as Spy-Bi-Wire (SBW).

MSP430 Hardware Tools User's Guide This manual describes the hardware of the TI MSP-FET430 Flash Emulation Tool (FET). The FET is the program development tool for the MSP430 ultra-low-power microcontroller. Both available interface types, the parallel port interface and the USB interface, are described.

Application Reports

MSP430 32-kHz Crystal Oscillators Selection of the correct crystal, correct load circuit, and proper board layout are important for a stable crystal oscillator. This application report summarizes crystal oscillator function and explains the parameters to select the correct crystal for MSP430 ultra-low-power operation. In addition, hints and examples for correct board layout are given. The document also contains detailed information on the possible oscillator tests to ensure stable oscillator operation in mass production.

MSP430 System-Level ESD Considerations System-Level ESD has become increasingly demanding with silicon technology scaling towards lower voltages and the need for designing cost-effective and ultra-low-power components. This application report addresses three different ESD topics to help board designers and OEMs understand and design robust system-level designs.

8.8 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
 - D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.

 - Publication IPC-7351 is recommended for alternate design.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
