

SCM3725ASA/SCM3728ASA Dual-Channel Digital Isolators

Features

- 3 V to 5.5 V level translation
- High common-mode transient immunity: 75 kV/μs typical
- High robustness to radiated and conducted noise
- High ESD rating
- Ultra low power consumption 0.58mA/channel(1Mbps)
- Wide temperature range: -40°C ~ 125°C
- Isolation voltages: AC 3000Vrms
- High data rate:10Mbps

Package

Applications

- General-purpose multichannel isolation
- Industrial field bus isolation

Mechanical package: SOP-8
(see "Ordering information" for details).

Functional

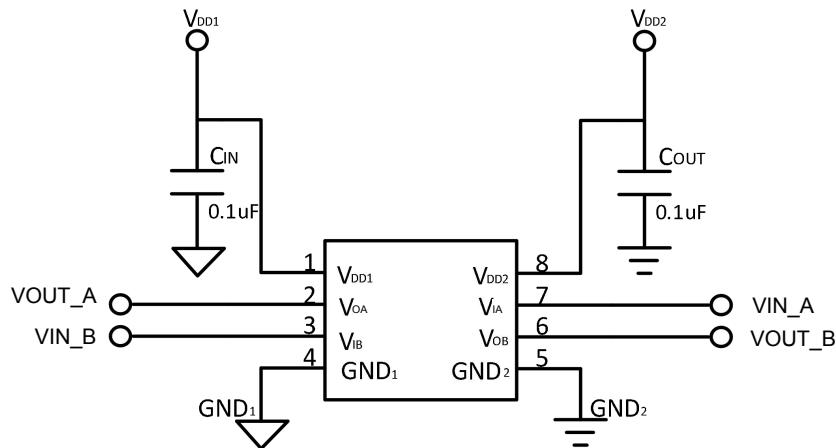

The SCM3725ASA/SCM3728ASA digital isolators by using matured standard semiconductor CMOS technology and Capacitance pulse isolation technology, these isolation components provide outstanding performance characteristics and reliability superior to alternatives such as optocoupler devices and other integrated isolators.

Capacitance pulse isolation technology is a new generation digital isolator technology . It uses the principle of capacitor voltage divider to transmit voltage signal directly cross the isolator capacitor without signal modulation and demodulation.

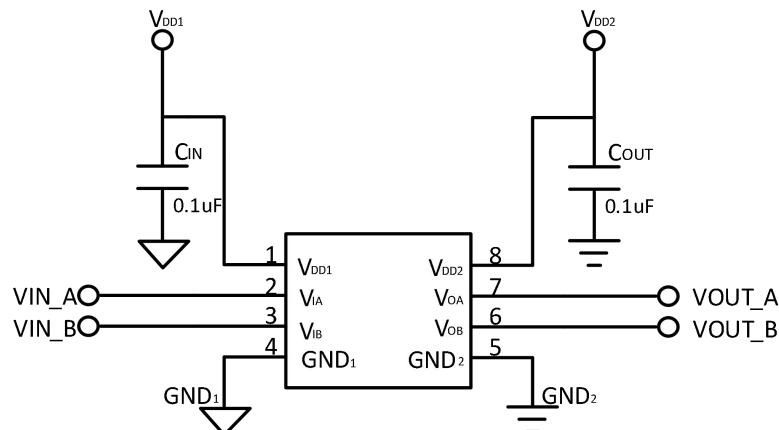

The SCM3725ASA/SCM3728ASA isolator data channels are independent and different models have different transmission directions with a withstand voltage rating of 3 kV rms and the data rate from DC up to 10Mbps . The devices operate with the supply voltage on either side ranging from 3.0 V to 5.5 V, providing compatibility with lower voltage systems as well as enabling voltage translation functionality across the isolation barrier. The fail-safe state is available in which the outputs transition to a preset state when the input power supply is not applied.

Product model

Model	Power supply range (V)	Data rate	Channel number	Output channel number	Withstand voltage(kV rms)	Default output	Package option	Pin number
SCM3725ASA	3.0~5.5	10Mbps	2	1	3	high	SOP	8
SCM3728ASA	3.0~5.5	10Mbps	2	2	3	low	SOP	8

Function table

Vlx Input ¹	VDD1 State ¹	VDD0 State ¹	Default Low	Default High	Test Conditions /Comments
			Vox Output ¹	Vox Output ¹	
Low	Powered ²	Powered ²	Low	Low	Normal operation
High	Powered ²	Powered ²	High	High	Normal operation
Open	Powered ²	Powered ²	Low	High	Default output
Don't Care ⁴	Unpowered ³	Powered ²	Low	High	Default output ⁵
Don't Care ⁴	Powered ²	Unpowered ³	High Impedance	High Impedance	

Notes:
1Vlx/Vox are the input/output signals of a given channel (A or B). VDD1/VDD0 are the supply voltages on the input/output signal sides of this given channel.

2Powered means $VDDx \geq 2.3V$

3Unpowered means $VDDx < 2.3V$

4Input signal (Vlx) must be in a low state to avoid powering the given VDD1 through its ESD protection circuitry.

5If the VDD1 goes into unpowered status, the channel outputs the default logic signal after around 1us. If the VDD1 goes into powered status, the channel outputs the input status logic signal after around 3us.

APPLICATIONS INFORMATION

OVERVIEW

The SCM3725ASA/SCM3728ASA are digital isolators product family based on unique Capacitance pulse isolation technology. Capacitance pulse isolation technology is a new generation digital isolator technology. It uses the principle of capacitor voltage divider to transmit signal directly cross the isolator capacitor without signal modulation and demodulation. Compare to the traditional Opto-couple technology, icoupler technology, OOK technology, Capacitance pulse isolation technology is a more essential and concise isolation signal transmit technology which leads to greatly simplification on circuit design and therefore significantly improves device performance, such as lower power consumption, faster speed, enhanced anti-interference ability, lower noise.

By using matured standard semiconductor CMOS technology and the innovative Capacitance pulse isolation technology design, these isolation components provide outstanding performance characteristics and reliability superior to alternatives such as optocoupler devices and other integrated isolators. The SCM3725ASA/SCM3728ASA isolator data channels are independent and are available in a variety of configurations with a withstand voltage rating of 1.5 kV rms to 6.0 kV rms and the data rate from DC up to 10Mbps (see the Ordering Guide).

The SCM3725ASA/SCM3728ASA are the outstanding 150Kbps dual-channel digital isolators with the enhanced ESD capability. the devices transmit data across an isolation barrier by layers of silicon dioxide isolation.

The devices operate with the supply voltage on either side ranging from 3.0 V to 5.5 V, offering voltage translation of 3.3 V and 5 V logic.

The SCM3725ASA/SCM3728ASA have very low propagation delay and high speed. The input/output design techniques allow logic and supply voltages over a wide range from 3.0 V to 5.5 V, offering voltage translation of 3.3 V and 5 V logic. The architecture is designed for high common-mode transient immunity and high immunity to electrical noise and magnetic interference.

PCB LAYOUT

The low-ESR ceramic bypass capacitors must be connected between V_{DD1} and GND_1 and between V_{DD2} and GND_2 . The bypass capacitors are placed on the PCB as close to the isolator device as possible. The recommended bypass capacitor value is between 0.1 μ F and 10 μ F. To enhance the robustness of a design, the user may also include resistors (50–300 Ω) in series with the inputs and outputs if the system is excessively noisy.

Avoid reducing the isolation capability. Keep the space underneath the isolator device free from metal such as planes, pads, traces and vias.

To minimize the impedance of the signal return loop, keep the solid ground plane directly underneath the high-speed signal path, the closer the better. The return path will couple between the nearest ground plane to the signal path. Keep suitable trace width for controlled impedance transmission lines interconnect.

To reduce the rise time degradation, keep the length of input/output signal traces as short as possible, and route low inductance loop for the signal path and its return path.

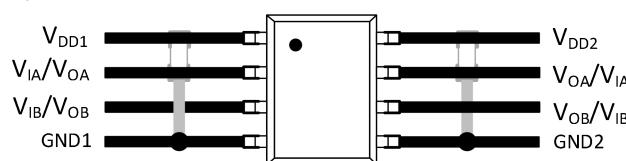

Figure 11. Recommended Printed Circuit Board Layout

JITTER MEASUREMENT

The eye diagram shown in the figure 9 provides the jitter measurement result for the SCM3725ASA/SCM3728ASA. The Keysight 81160A pulse function arbitrary generator works as the data source for the SCM3725ASA/SCM3728ASA, which generates 10Mbps pseudo random bit sequence (PRBS). The Keysight DSOS104A digital storage oscilloscope captures the SCM3725ASA/SCM3728ASA output waveform and recoveries the eye diagram with the SDA jitter tools and eye diagram analysis tools. The result shows a typical measurement 120ps p-p jitter.

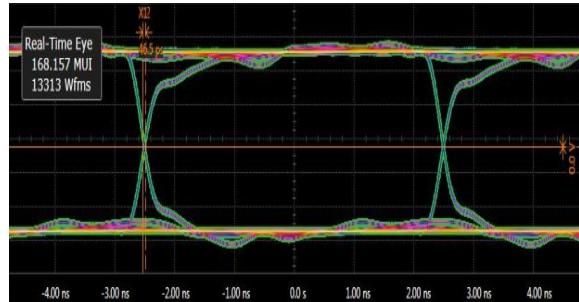

Figure 12. SCM3725ASA/SCM3728ASA Eye Diagram

CMTI MEASUREMENT

To measure the Common-Mode Transient Immunity (CMTI) of SCM3725ASA/SCM3728ASA isolator under specified common-mode pulse magnitude (VCM) and specified slew rate of the common-mode pulse ($dVCM/dt$) and other specified test or ambient conditions, The common-mode pulse generator (G1) will be capable of providing fast rising and falling pulses of specified magnitude and duration of the common-mode pulse (VCM) and the maximum common-mode slew rates ($dVCM/dt$) can be applied to SCM3725ASA/SCM3728ASA isolator coupler under measurement. The common-mode pulse is applied between one side ground GND1 and the other side ground GND2 of SCM3725ASA/SCM3728ASA isolator and shall be capable of providing positive transients as well as negative transients.

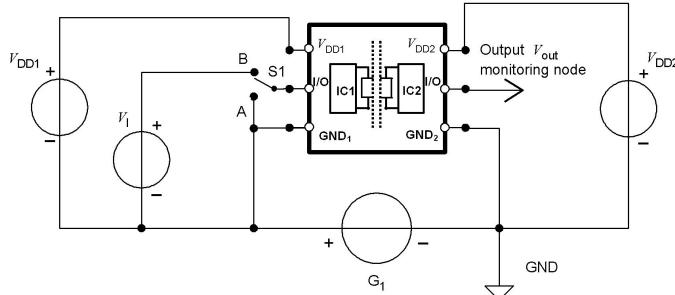

Figure 13. Common-mode transient immunity (CMTI) measurement
