Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (\_), the underscore (\_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (\_). Please check the ON Semiconductor website to verify the updated device numbers. The most current and up-to-date ordering information can be found at [www.onsemi.com](http://www.onsemi.com). Please email any questions regarding the system integration to [Fairchild\\_questions@onsemi.com](mailto:Fairchild_questions@onsemi.com).

# FAN73895 3-Phase Half-Bridge Gate-Drive IC

## Features

- Floating Channel for Bootstrap Operation to +600 V
- Typically 350 mA/650 mA Sourcing/Sinking Current-Driving Capability for All Channels
- Extended Allowable Negative  $V_S$  Swing to -9.8 V for Signal Propagation at  $V_{DD}=V_{BS}=15$  V
- Output In- Phase with Input Signal
- Over-Current Shutdown Turns Off All Six Drivers
- Matched Propagation Delay for All Channels
- 3.3 V and 5.0 V Input Logic Compatible
- Adjustable Fault-Clear Timing
- Built-in Advanced Input Filter
- Built-in Shoot-Through Prevention Logic
- Built-in Soft Turn-Off Function
- Common-Mode dv/dt Noise-Canceling Circuit
- Built-in UVLO Functions for All Channels

## Description

The FAN73895 is a monolithic three-phase half-bridge gate-drive IC designed for high-voltage, high-speed, driving MOSFETs and IGBTs operating up to +600 V.

Fairchild's high-voltage process and common-mode noise-canceling technique provide stable operation of high-side drivers under high-dv/dt noise circumstances.

An advanced level-shift circuit allows high-side gate driver operation up to  $V_S = -9.8$  V (typical) for  $V_{BS} = 15$  V.

The protection functions include under-voltage lockout and inverter over-current trip with an automatic fault-clear function. Over-current protection that terminates all six outputs can be derived from an external current-sense resistor. An open-drain fault signal is provided to indicate that an over-current or under-voltage shutdown has occurred. The UVLO circuits prevent malfunction when  $V_{DD}$  and  $V_{BS}$  are lower than the threshold voltage.

Output drivers typically source and sink 350 mA and 650 mA, respectively; which is suitable for three-phase half-bridge applications in motor drive systems.

## Applications

- 3-Phase Motor Inverter Driver
- Air Conditioner, Washing Machine, Refrigerator, Dish Washer
- Industrial Inverter – Sewing Machine, Power Tool
- General-Purpose Three-Phase Inverter

Figure 1. 28-SOIC

## Ordering Information

Part Number	Package	Operating Temperature	Packing Method
FAN73895MX <sup>(1)</sup>	28-Lead, Small Outline Integrated Circuit, (SOIC)	-40 to +125°C	Tape & Reel

### Note:

1. These devices passed wave-soldering test by JESD22A-111.

### Typical Application Diagram

Figure 2. 3-Phase BLDC Motor Drive Application

### Internal Block Diagram

Figure 3. Functional Block Diagram

## Pin Configuration

Figure 4. Pin Assignments

## Pin Definitions

Pin	Name	Description
1	V <sub>DD</sub>	Logic and low-side gate driver power supply voltage.
2	HIN1	Logic Input 1 for high-side gate 1 driver.
3	HIN2	Logic Input 2 for high-side gate 2 driver.
4	HIN3	Logic Input 3 for high-side gate 3 driver.
5	LIN1	Logic Input 1 for low-side gate 1 driver.
6	LIN2	Logic Input 2 for low-side gate 2 driver.
7	LIN3	Logic Input 3 for low-side gate 3 driver.
8	$\overline{FO}$	Fault output with open drain (indicates over-current and low-side under-voltage).
9	CS	Analog input for over-current shutdown.
10	EN	Logic input for shutdown functionality.
11	RCIN	An external RC network input used to define the fault-clear delay.
12	V <sub>SS</sub>	Logic ground.
13	COM	Low-side driver return.
14	LO3	Low-side gate driver 3 output.
15	LO2	Low-side gate driver 2 output.
16	LO1	Low-side gate driver 1 output.
17, 21, 25	NC	No connect.
18	V <sub>S3</sub>	High-side driver 3 floating supply offset voltage.
19	HO3	High-side driver 3 gate driver output.
20	V <sub>B3</sub>	High-side driver 3 floating supply.
22	V <sub>S2</sub>	High-side driver 2 floating supply offset voltage.
23	HO2	High-side driver 2 gate driver output.
24	V <sub>B2</sub>	High-side driver 2 floating supply.
26	V <sub>S1</sub>	High-side driver 1 floating supply offset voltage.
27	HO1	High-side driver 1 gate driver output.
28	V <sub>B1</sub>	High-side driver 1 floating supply.

## Absolute Maximum Ratings

Stresses exceeding the Absolute Maximum Ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.  $T_A=25^{\circ}\text{C}$ , unless otherwise specified.

Symbol	Parameter	Min.	Max.	Unit
$V_S$	High-Side Floating Offset Voltage	$V_{B1,2,3}-25$	$V_{B1,2,3}+0.3$	V
$V_B$	High-Side Floating Supply Voltage	-0.3	625.0	V
$V_{DD}$	Low-Side and Logic-Fixed supply voltage	-0.3	25.0	V
$V_{HO}$	High-Side Floating Output Voltage $V_{HO1,2,3}$	$V_{S1,2,3}-0.3$	$V_{B1,2,3}+0.3$	V
$V_{LO}$	Low-Side Floating Output Voltage $V_{LO1,2,3}$	-0.3	$V_{DD}+0.3$	V
$V_{IN}$	Input Voltage ( HINx, LINx, CS, and EN) <sup>(2)</sup>	-0.3	5.5	V
$V_{FO}$	Fault Output Voltage ( $\overline{FO}$ )	-0.3	$V_{DD}+0.3$	V
$dV_S/dt$	Allowable Offset Voltage Slew Rate		$\pm 50$	V/ns
$P_D$	Power Dissipation <sup>(3,4)</sup>		1.4	W
$\theta_{JA}$	Thermal Resistance		70	$^{\circ}\text{C/W}$
$T_J$	Junction Temperature		150	$^{\circ}\text{C}$
$T_{STG}$	Storage Temperature	-55	150	$^{\circ}\text{C}$

### Notes:

- All input voltage (HINx, LINx, CS, and EN) are referenced to  $V_{SS}$  and do not exceed maximum voltage rating.
- Mounted on 76.2 x 114.3 x 1.6 mm PCB (FR-4 glass epoxy material). Refer to the following standards:  
*JESD51-2: Integral circuit's thermal test method environmental conditions, natural convection;*  
*JESD51-3: Low effective thermal conductivity test board for leaded surface-mount packages.*
- Do not exceed maximum power dissipation ( $P_D$ ) under any circumstances.

## Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to Absolute Maximum Ratings.

Symbol	Parameter	Min.	Max.	Unit
$V_{B1,2,3}$	High-Side Floating Supply Voltage	$V_{S1,2,3}+10$	$V_{S1,2,3}+20$	V
$V_{S1,2,3}$	High-Side Floating Supply Offset Voltage	$6-V_{DD}$	600	V
$V_{DD}$	Low-Side and Logic Fixed Supply Voltage	10	20	V
$V_{HO1,2,3}$	High-Side Output Voltage	$V_{S1,2,3}$	$V_{B1,2,3}$	V
$V_{LO1,2,3}$	Low-Side Output Voltage	COM	$V_{DD}$	V
$V_{FO}$	Fault Output Voltage ( $\overline{FO}$ )	$V_{SS}$	$V_{DD}$	V
$V_{CS}$	Current-Sense Pin Input Voltage	$V_{SS}$	5	V
$V_{IN}$	Logic Input Voltage (HIN1,2,3 and LIN1,2,3 )	$V_{SS}$	5	V
COM	Low-side driver return	-5	5	V
$T_A$	Ambient Temperature	-40	+125	$^{\circ}\text{C}$

## Electrical Characteristics

$V_{BIAS}$  ( $V_{DD}$ ,  $V_{BS1,2,3}$ ) = 15.0 V and  $T_A$  = 25°C unless otherwise specified. The  $V_{IN}$  and  $I_{IN}$  parameters are referenced to  $V_{SS}$  and are applicable to all six channels. The  $V_O$  and  $I_O$  parameters are referenced to  $V_{S1,2,3}$  and COM and are applicable to the respective output leads: HO1,2,3 and LO1,2,3. The  $V_{DDUV}$  parameters are referenced to  $V_{SS}$ . The  $V_{BSUV}$  parameters are referenced to  $V_{S1,2,3}$ .

$R_{DSFO}$	Fault Output On Resistance	$I_{FO}=1.5$ mA	90	130	170	Ω

**Note:**

5. These parameters are guaranteed by design.

## Dynamic Electrical Characteristics

$T_A=25^\circ\text{C}$ ,  $V_{BIAS}$  ( $V_{DD}$ ,  $V_{BS1,2,3}$ ) = 15.0 V,  $V_{S1,2,3}$  = COM,  $C_{RCIN}=2$  nF, and  $C_{Load}$  = 1000 pF unless otherwise specified.

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$t_{ON}$	Turn-On Propagation Delay	$V_{LIN1,2,3}=V_{HIN1,2,3}=5$ V, $V_{S1,2,3}=0$ V	350	500	650	ns
$t_{OFF}$	Turn-Off Propagation Delay	$V_{LIN1,2,3}=V_{HIN1,2,3}=0$ V, $V_{S1,2,3}=0$ V	350	500	650	ns
$t_R$	Turn-On Rise Time	$V_{LIN1,2,3}=V_{HIN1,2,3}=5$ V	20	50	100	ns
$t_F$	Turn-Off Fall Time	$V_{LIN1,2,3}=V_{HIN1,2,3}=0$ V	10	30	80	ns
$t_{EN}$	Enable LOW to Output Shutdown Delay		400	500	600	ns
$t_{CSBLT}$	CS Pin Leading-Edge Blanking Time		400	650	850	ns
$t_{CSFO}$	Time from CS Triggering to $\overline{FO}$	From $V_{CSC}=1$ V to $\overline{FO}$ Turn-Off		850	1300	ns
$t_{CSOFF}$	Time from CS Triggering to Low-Side Gate Outputs Turn-Off	From $V_{CSC}=1$ V to Starting Gate Turn-Off		850	1300	ns
$t_{FLTIN}$	Input Filtering Time <sup>(6)</sup> ( $HINx$ , $LINx$ , EN)		170	250	330	ns
$t_{FLTCLR}$	Fault-Clear Time			1.30	2.35	ms
DT	Dead Time		230	320	400	ns
MDT	Dead-Time Matching (All Six Channels) <sup>(7)</sup>				50	ns
MT	Delay Matching (All Six Channels) <sup>(8)</sup>				50	ns
PM	Output Pulse-Width Matching <sup>(9)</sup>	$PW_{IN} > 1$ μs		50	100	ns

**Notes:**

- The minimum width of the input pulse should exceed 500 ns to ensure the filtering time of the input filter is exceeded.
- MDT is defined as  $|DT1-DT2|$  referenced to Figure 38.
- MT is defined as an absolute value of matching delay time between High-side and Low-side.
- PM is defined as an absolute value of matching pulse-width between Input and Output.

### Switching Time Definitions

Figure 35. Switching Time Waveform Definitions

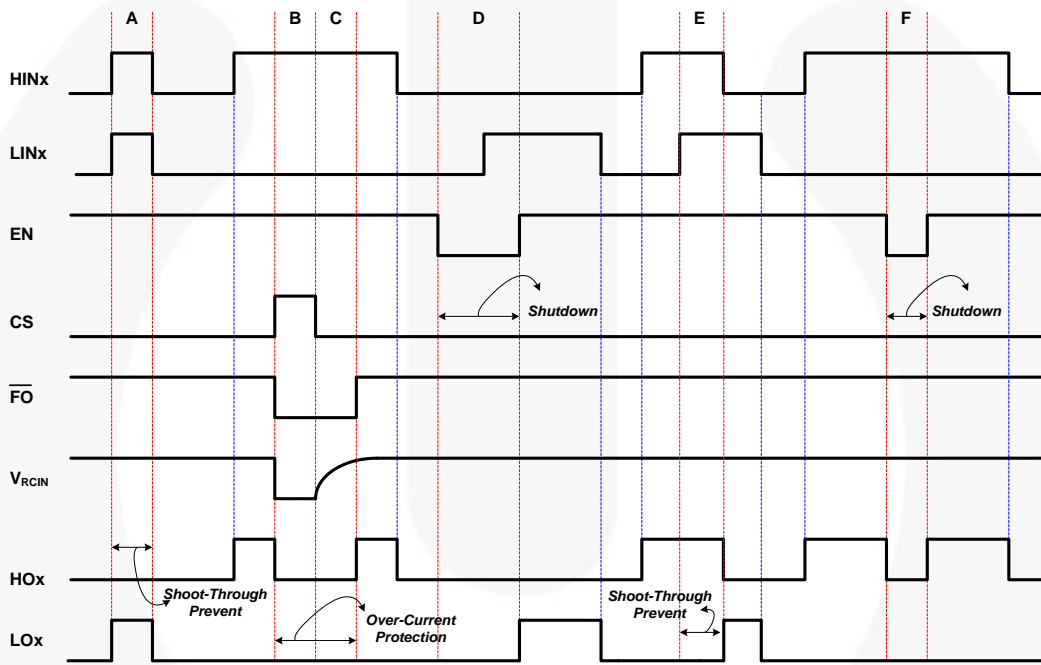

Figure 36. Input / Output Timing Diagram

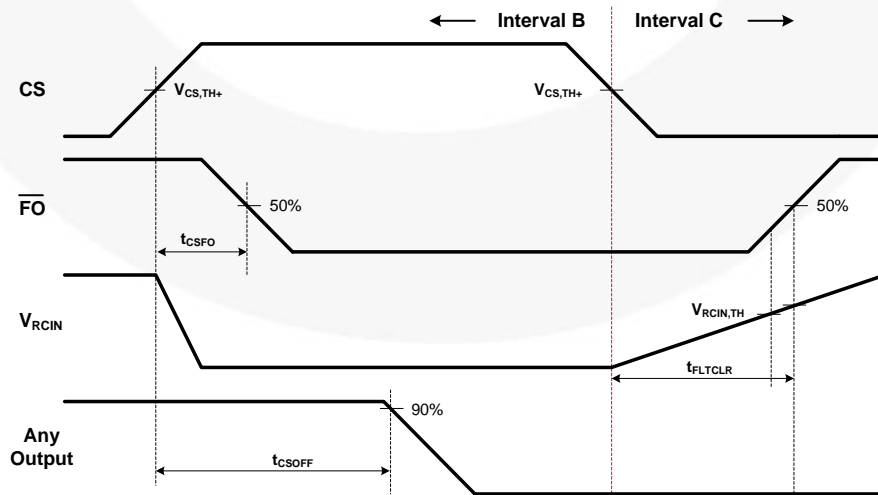

Figure 37. Detailed View of B and C Intervals During Over-Current Protection

## Applications Information

### 1. Dead Time

Dead time is automatically inserted whenever the dead time of the external two input signals (between HINx and LINx signals) is shorter than internal fixed dead times (DT1 and DT2). Otherwise, external dead times larger than internal dead times are not modified by the gate driver and internal dead-time waveform definition is shown in Figure 38.

Figure 38. Internal Dead-Time Definitions

### 2. Protection Function

#### 2.1 Fault Out (FO) and Under-Voltage Lockout

The high- and low-side drivers include under-voltage lockout (UVLO) protection circuitry that monitors the supply voltage for  $V_{DD}$  and  $V_{BS}$  independently. It can be designed to prevent malfunction when  $V_{DD}$  and  $V_{BS}$  are lower than the specified threshold voltage. The UVLO hysteresis prevents chattering during power-supply transitions. Moreover, the fault signal (power supply voltage FO) goes to LOW state to operate reliably during power-on events when the power supply ( $V_{DD}$ ) is below the under-voltage lockout high threshold voltage for the circuit (during  $t_1 \sim t_2$ ). The UVLO circuit is not otherwise activated; shown Figure 39. If  $V_{DD}$  is lower than 3.5 V, the fault signal cannot be driven to LOW state because  $V_{DD}$  is not enough to drive internal circuit.

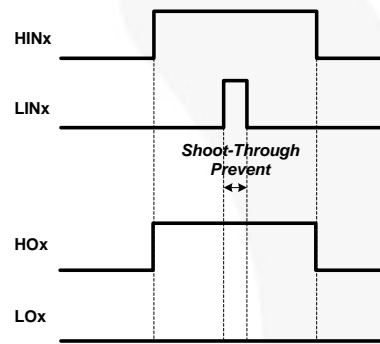

Figure 39. Waveforms for Under-Voltage Lockout

#### 2.2 Shoot-Through Protection

The shoot-through protection circuitry prevents both high- and low-side switches from conducting at the same time, as shown Figure 40.

Example A

Example B

Figure 40. Shoot-Through Protection

An interlock function is a device used to prevent both high- and low-side switches from conducting at the same time as shown Figure 41. In most applications an interlock is used to help prevent a device from harming its operator or damaging itself by when two input signals of a same leg are activated simultaneously, only one output is activated.

- S1 : High-side first → First input output mode
- S2 : Low-side noise → No LOx output mode
- S3 : High-side noise → No HOx output mode
- S4 : Low-side first → First input output mode
- S5 : In-phase mode → No HOx output

Figure 41. Interlock Function

### 2.3 Enable Input

When the EN pin is in HIGH state, the gate driver operates normally. When a condition occurs that should shut down the gate driver, the EN pin should be LOW. The enable circuitry has an input filter; the minimum input duration is specified by  $t_{FLTIN}$  (typically 250 ns).

**Figure 42. Output Enable Timing Waveform**

### 2.4 Fault-Out (FO) and Over-Current Protection

FAN73895 provides an integrated fault output (FO) and an adjustable fault-clear timer ( $t_{FLTCLR}$ ). There are two situations that cause the gate driver to report a fault via the FO pin. The first is an under-voltage condition of low-side gate driver supply voltage ( $V_{DD}$ ) and the second is when the current-sense pin (CS) recognizes a fault. If a fault condition occurs, the FO pin is internally pulled to COM, the fault-clear timer is activated, and all outputs (HO1, 2, 3 and LO1, 2, 3) of the gate driver are turned off. The fault output stays LOW until the fault condition has been removed and the fault-clear timer expires. Once the fault-clear timer expires, the voltage on the FO pin returns to pull-up voltage.

The fault-clear time ( $t_{FLTCLR}$ ) is determined by an internal current source ( $I_{RCIN}=5 \mu A$ ) and an external  $C_{RCIN}$  at the RCIN pin, as shown as:

$$t_{FLTCLR} = \frac{C_{RCIN} \times V_{RCIN,TH}}{I_{RCIN}} [s] \quad (1)$$

The  $R_{DSRCIN}$  of the MOSFET is a characteristic discharge curve with respect to the external capacitor  $C_{RCIN}$ . The time constant is defined by the external capacitor  $C_{RCIN}$  and the  $R_{DSRCIN}$  of the MOSFET.

The output of current-sense comparator (CS\_COMP) passes a noise filter, which inhibits an over-current shutdown caused by parasitic voltage spikes of  $V_{CS}$ .

This corresponds to a voltage level at the comparator of  $V_{CSTH+} - V_{CSHYS} = 500 \text{ mV} - 60 \text{ mV} = 440 \text{ mV}$ , where  $V_{CSHYS}=60 \text{ mV}$  is the hysteresis of the current comparator (CS\_COMP), as shown in Figure 43.

**Figure 43. Over-Current Protection**

Figure 44 shows the waveform definitions of RCIN, FO, and the low-side driver; which uses a soft turn-off method when an under-voltage condition of the low-side gate driver supply voltage ( $V_{DD}$ ) or the current-sense pin (CS) recognizes a fault. If a fault condition occurs, the FO Pin is internally pulled to COM and all outputs (HO1, 2, 3 and LO1, 2, 3) of the gate driver are turned off. Low-side outputs decline linearly by the internal sink current source ( $I_{SOFT}=40\text{mA}$ ) for soft turn-off, as shown in Figure 44.

**Figure 44. RCIN and Fault-Clear Waveform Definition**

## 3. Noise Filter

### 3.1 Input Noise Filter

Figure 45 shows the input noise filter method, which has symmetry duration between the input signal ( $t_{INPUT}$ ) and the output signal ( $t_{OUTPUT}$ ) and helps to reject noise spikes and short pulses. This input filter is applied to the HINx, LINx, and EN inputs. The upper pair of waveforms (Example A) shows input signal duration ( $t_{INPUT}$ ) much longer than input filter time ( $t_{FLTIN}$ ); it is approximately the same duration between the input signal time ( $t_{INPUT}$ ) and the output signal time ( $t_{OUTPUT}$ ). The lower pair of waveforms (Example B) shows an input signal time ( $t_{INPUT}$ ) slightly longer than input filter time ( $t_{FLTIN}$ ); it is approximately the same duration between input signal time ( $t_{INPUT}$ ) and the output signal time ( $t_{OUTPUT}$ ).

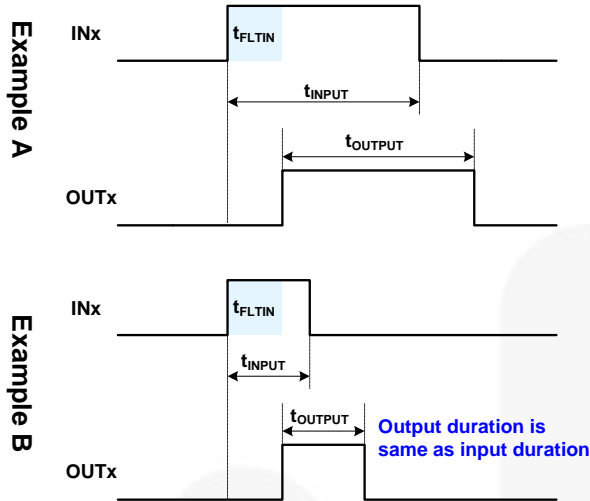

Figure 45. Input Noise Filter Definition

**3.2. Short-Pulsed Input Noise Rejection Method**

The input filter circuitry provides protection against short-pulsed input signals ( $HINx$ ,  $LINx$ , and  $EN$ ) on the input signal lines by applied noise signal.

If the input signal duration is less than input filter time ( $t_{FLTIN}$ ), the output does not change states.

Example A and B of the Figure 46 show the input and output waveforms with short-pulsed noise spikes with a duration less than input filter time; the output does not change states.

Figure 46. Noise Rejecting Input Filter Definition

Figure 47 shows the characteristics of the input filters while receiving narrow ON and OFF pulses. If input signal pulse duration,  $PW_{IN}$ , is less than input filter time,  $t_{FLTIN}$ ; the output pulse,  $PW_{OUT}$ , is zero. The input signal is rejected by input filter. Once the input signal pulse duration,  $PW_{IN}$ , exceeds input filter time,  $t_{FLTIN}$ , the output pulse durations,  $PW_{OUT}$ , matches the input pulse durations,  $PW_{IN}$ . FAN73895 input filter time,  $t_{FLTIN}$ , is about 250 ns for the high- and low-side outputs.

DETAIL A  
SCALE: 2:1

**NOTES:**

- A. THIS PACKAGE DOES NOT FULLY CONFORM TO JEDEC REGISTRATION, MS-013.
- B. DIMENSIONS ARE IN MILLIMETERS.
- C. DIMENSIONS AND TOLERANCES PER ASME Y14.5M, 2009.
- D. DIMENSIONS DO NOT INCLUDE MOLD FLASH AND BURRS.
- E. LAND PATTERN STANDARD : SOIC127P1030X265-28N
- F. DRAWING FILENAME: MKT-M28Brev4.
