

12-Bit, Parallel Input, Multiplying Digital-to-Analog Converter

FEATURES

- 2.5V to 5.5V Supply Operation
- Fast Parallel Interface:
17ns Write Cycle
- Update Rate of 20.4MSPS
- 10MHz Multiplying Bandwidth
- $\pm 10V$ Reference Input
- Low Glitch Energy: 5nV-s
- Extended Temperature Range:
 $-40^{\circ}C$ to $+125^{\circ}C$
- 20-Lead TSSOP Packages
- 12-Bit Monotonic
- $\pm 1LSB$ INL
- 4-Quadrant Multiplication
- Power-On Reset with Brownout Detection
- Readback Function
- Industry-Standard Pin Configuration

APPLICATIONS

- Portable Battery-Powered Instruments
- Waveform Generators
- Analog Processing
- Programmable Amplifiers and Attenuators
- Digitally-Controlled Calibration
- Programmable Filters and Oscillators
- Composite Video
- Ultrasound

DESCRIPTION

The DAC7821 is a CMOS 12-bit current output digital-to-analog converter (DAC). This device operates from a single 2.5V to 5.5V power supply, making it suitable for battery-powered and many other applications.

This DAC operates with a fast parallel interface. Data readback allows the user to read the contents of the DAC register via the DB pins. On power-up, the internal register and latches are filled with zeroes and the DAC outputs are at zero scale.

The DAC7821 offers excellent 4-quadrant multiplication characteristics, with a large signal multiplying bandwidth of 10MHz. The applied external reference input voltage (V_{REF}) determines the full-scale output current. An integrated feedback resistor (R_{FB}) provides temperature tracking and full-scale voltage output when combined with an external current-to-voltage precision amplifier.

The DAC7821 is available in a 20-lead TSSOP package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PACKAGE/ORDERING INFORMATION

For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

	DAC7821	UNIT
V _{DD} to GND	–0.3 to +7	V
Digital input voltage to GND	–0.3 to V _{DD} + 0.3	V
V _(IOUT) to GND	–0.3 to V _{DD} + 0.3	V
Operating temperature range	–40 to +125	°C
Storage temperature range	–65 to +150	°C
Junction temperature (T _J max)	+150	°C
ESD Rating, HBM	3000	V
ESD Rating, CDM	1000	V

(1) Stresses above those listed under absolute maximum ratings may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

$V_{DD} = +2.5V$ to $+5.5V$; $I_{OUT1} = \text{Virtual GND}$; $I_{OUT2} = 0V$; $V_{REF} = +10V$; $T_A = \text{full operating temperature}$. All specifications -40°C to $+125^\circ\text{C}$, unless otherwise noted.

DEVICE INFORMATION

TERMINAL FUNCTIONS

TERMINAL		DESCRIPTION
TSSOP NO.	NAME	
1	I_{OUT1}	DAC current output.
2	I_{OUT2}	DAC analog ground. This pin is normally tied to the analog ground of the system.
3	GND	Ground pin.
4–15	DB11 – DB0	Parallel data bits 11 to 0.
16	\overline{CS}	Chip select input. Active low. Used in conjunction with R/\overline{W} to load parallel data to the input latch or read data from the DAC register. Rising edge of \overline{CS} loads data.
17	R/\overline{W}	Read/Write. When low, use in conjunction with \overline{CS} to load parallel data. When high, use with \overline{CS} to read back contents of DAC register.
18	V_{DD}	Positive power supply input. These parts can be operated from a supply of 2.5V to 5.5V.
19	V_{REF}	DAC reference voltage input.
20	R_{FB}	DAC feedback resistor pin. Establish voltage output for the DAC by connecting to external amplifier output.

TYPICAL CHARACTERISTICS: $V_{DD} = +5V$

At $T_A = +25^\circ C$, unless otherwise noted.

THEORY OF OPERATION

The DAC7821 is a single channel, current output, 12-bit digital-to-analog converter (DAC). The architecture, illustrated in [Figure 25](#), is an R-2R ladder configuration with the three MSBs segmented. Each 2R leg of the ladder is either switched to I_{OUT1} or the I_{OUT2} terminal. The I_{OUT1} terminal of the DAC is held at a virtual GND potential by the use of an external I/V converter op amp. The R-2R ladder is connected to an external reference input V_{REF} that determines the DAC full-scale current. The R-2R ladder presents a code-independent load impedance to the external reference of $10k\Omega \pm 20\%$. The external reference voltage can vary over a range of $-15V$ to $+15V$, thus providing bipolar I_{OUT} current operation. By using an external I/V converter and the DAC7821 R_{FB} resistor, output voltage ranges of $-V_{REF}$ to V_{REF} can be generated.

Figure 25. Equivalent R-2R DAC Circuit

When using an external I/V converter and the DAC7821 R_{FB} resistor, the DAC output voltage is given by [Equation 1](#):

$$V_{OUT} = -V_{REF} \times \frac{CODE}{4096} \quad (1)$$

Each DAC code determines the 2R leg switch position to either GND or I_{OUT} . Because the DAC output impedance as seen looking into the I_{OUT1} terminal changes versus code, the external I/V converter noise gain will also change. Because of this, the external I/V converter op amp must have a sufficiently low offset voltage such that the amplifier offset is not modulated by the DAC I_{OUT1} terminal impedance change. External op amps with large offset voltages can produce INL errors in the transfer function of the DAC7821 as a result of offset modulation versus DAC code.

For best linearity performance of the DAC7821, an op amp with a low input offset voltage ([OPA277](#)) is recommended (see [Figure 26](#)). This circuit allows V_{REF} swinging from $-10V$ to $+10V$.

Figure 26. Voltage Output Configuration

APPLICATION INFORMATION

Stability Circuit

For a current-to-voltage design (see Figure 27), the DAC7821 current output (I_{OUT}) and the connection with the inverting node of the op amp should be as short as possible and according to correct printed circuit board (PCB) layout design practices. For each code change, there is a step function. If the gain bandwidth product (GBP) of the op amp is limited and parasitic capacitance is excessive at the inverting node, then gain peaking is possible. Therefore, for circuit stability, compensation capacitor C_1 (1pF to 5pF typ) can be added to the design, as shown in Figure 27.

Figure 27. Gain Peaking Prevention Circuit with Compensation Capacitor

Amplifier Selection

There are many choices and many differences in selecting the proper operational amplifier for a multiplying DAC (MDAC). Making the analog signal out of the MDAC is one critical aspect. However, there are also other issues to take into account such as amplifier noise, input bias current, and offset voltage, as well as MDAC resolution and glitch energy. Table 1 and Table 2 suggest some suitable operational amplifiers for low power, fast settling, and high-speed applications. A greater selection of operational amplifiers can be found at www.ti.com/amplifier.

Positive Voltage Output Circuit

As Figure 28 illustrates, in order to generate a positive voltage output, a negative reference is input to the DAC7821. This design is suggested instead of using an inverting amp to invert the output because of possible resistor tolerance errors. For a negative reference, V_{OUT} and GND of the reference are level-shifted to a virtual ground and a $-2.5V$ input to the DAC7821 with an op amp.

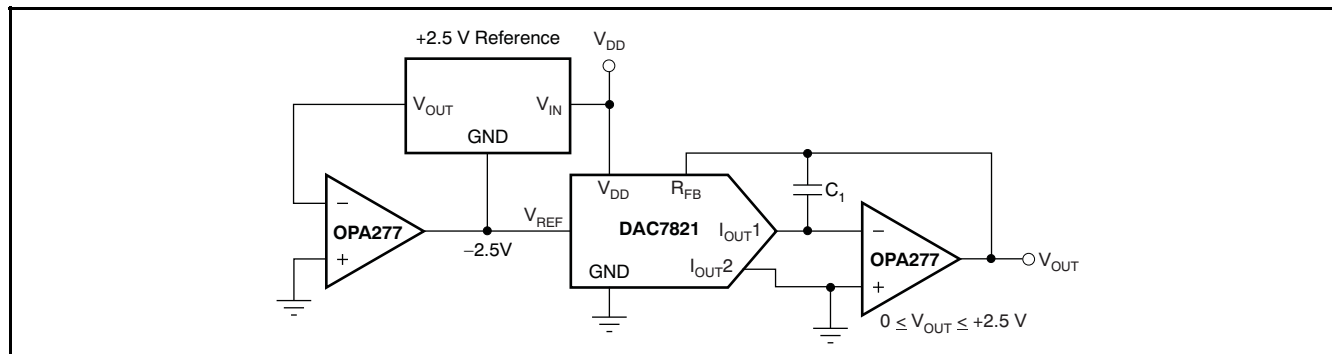

Figure 28. Positive Voltage Output Circuit

Bipolar Output Section

The DAC7821, as a 2-quadrant multiplying DAC, can be used to generate a unipolar output. The polarity of the full-scale output I_{OUT} is the inverse of the input reference voltage at V_{REF} .

Some applications require full 4-quadrant multiplying capabilities or bipolar output swing. As shown in Figure 29, external op amp U4 is added as a summing amp and has a gain of 2X that widens the output span to 5V. A 4-quadrant multiplying circuit is implemented by using a 2.5V offset of the reference voltage to bias U4. According to the circuit transfer equation given in Equation 2, input data (D) from code 0 to full-scale produces output voltages of $V_{OUT} = -2.5V$ to $V_{OUT} = +2.5V$.

$$V_{OUT} = \left(\frac{D}{0.5 \times 2^N} - 1 \right) \times V_{REF} \tag{2}$$

External resistance mismatching is the significant error in Figure 29.

Figure 29. Bipolar Output Circuit

Programmable Current Source Circuit

A DAC7821 can be integrated into the circuit in [Figure 30](#) to implement an improved Howland current pump for precise voltage-to-current conversions. Bidirectional current flow and high voltage compliance are two features of the circuit. With a matched resistor network, the load current of the circuit is shown by [Equation 3](#):

$$I_L = \frac{(R_2 + R_3)/R_1}{R_3} \times V_{REF} \times D \quad (3)$$

The value of R_3 in the previous equation can be reduced to increase the output current drive of U_3 . U_3 can drive $\pm 20\text{mA}$ in both directions with voltage compliance limited up to 15V by the U_3 voltage supply. Elimination of the circuit compensation capacitor C_1 in the circuit is not suggested as a result of the change in the output impedance Z_O , according to [Equation 4](#):

$$Z_O = \frac{R_1' R_3 (R_1 + R_2)}{R_1 (R_2' + R_3') - R_1' (R_2 + R_3)} \quad (4)$$

As shown in [Equation 4](#), with matched resistors, Z_O is infinite and the circuit is optimum for use as a current source. However, if unmatched resistors are used, Z_O is positive or negative with negative output impedance being a potential cause of oscillation. Therefore, by incorporating C_1 into the circuit, possible oscillation problems are eliminated. The value of C_1 can be determined for critical applications; for most applications, however, a value of several pF is suggested.

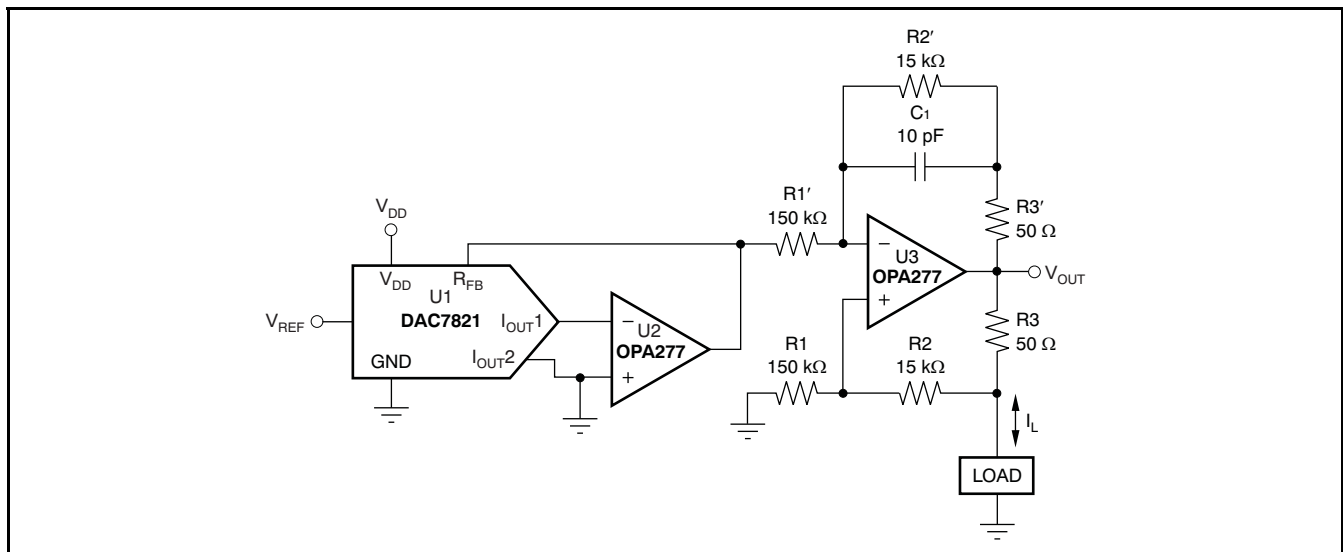

Figure 30. Programmable Bidirectional Current Source Circuit

Parallel Interface

Data are loaded to the DAC7821 as a 12-bit parallel word. The bidirectional bus is controlled with \overline{CS} and R/\overline{W} , allowing data to be written to or read from the DAC register. To write to the device, \overline{CS} and R/\overline{W} are brought low, and data available on the data lines fill the input register. The rising edge of \overline{CS} latches the data and transfers the latched data-word to the DAC register. The DAC latches are not transparent; therefore, a write sequence must consist of a falling and rising edge on \overline{CS} in order to ensure that data are loaded to the DAC register and its analog equivalent is reflected on the DAC output.

To read data stored in the device, R/\overline{W} is held high and \overline{CS} is brought low. Data are loaded from the DAC register back to the input register and out onto the data line, where it can be read back to the controller.

Cross-Reference

The DAC7821 has an industry-standard pinout. [Table 3](#) provides the cross-reference information.

Table 3. Cross-Reference

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate design.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
