features

- Up to 300-mA Output Current
- Less Than 10-mV$_{pp}$ Output Voltage Ripple
- No Inductors Required/Low EMI
- Regulated 5-V ±4% Output
- Only Four External Components Required
- Up to 90% Efficiency
- 2.7-V to 5.4-V Input Voltage Range
- 60-μA Quiescent Supply Current
- 0.05-μA Shutdown Current
- Load Isolated in Shutdown
- Space-Saving Thermally-Enhanced TSSOP PowerPAD™ Package
- Evaluation Module Available (TPS60110EVM−132)

description

The TPS60110 step-up, regulated charge pump generates a 5-V ±4% output voltage from a 2.7-V to 5.4-V input voltage (three alkaline, NiCd, or NiMH batteries; or, one lithium or lithium ion battery). Output current is 300 mA from a 3-V input. Only four external capacitors are needed to build a complete low-noise dc/dc converter. The push-pull operating mode of two single-ended charge pumps assures the low output voltage ripple as current is continuously transferred to the output. From a 3-V input, the TPS60110 can start into full load with loads as low as 16 Ω.

The TPS60110 features either constant frequency mode to minimize noise and output voltage ripple or the power-saving pulse-skip mode to extend battery life at light loads. The TPS60110 switching frequency is 300 kHz. The logic shutdown function reduces the supply current to 1-μA (max) and disconnects the load from the input. Special current-control circuitry prevents excessive current from being drawn from the battery during start-up. This dc/dc converter requires no inductors and has low EMI. It is available in the small 20-pin TSSOP PowerPAD™ package (PWP).

applications

- Replaces DC/DC Converters With Inductors in
  - Battery-Powered Applications
  - Li-Ion Battery to 5-V Conversion
  - Portable Instruments
  - Battery-Powered Microprocessor Systems
  - Miniature Equipment
  - Backup-Battery Boost Converters
  - PDAs
  - Laptops
  - Handheld Instrumentation
  - Medical Instruments

AVAILABLE OPTIONS

PACKAGE
TSSOP† (PWP)
TPS60110PWP

† This package is available taped and reeled. To order this packaging option, add an R suffix to the part number (e.g., TPS60110PWPR).

Terminal Functions

TERMINAL NAME	TERMINAL NO.	I/O	DESCRIPTION
CLK	19	I	Input for external clock signal. If the internal clock is used, connect this terminal to GND.
C1+	6		Positive terminal of the charge-pump capacitor C_{1F}
C1−	8		Negative terminal of the charge-pump capacitor C_{1F}
C2+	15		Positive terminal of the charge-pump capacitor C_{2F}
C2−	13		Negative terminal of the charge-pump capacitor C_{2F}
COM	18	I	Mode selection. When COM is logic low the charge pump operates in push-pull mode to minimize output ripple. When COM is connected to IN the regulator operates in single-ended mode requiring only one flying capacitor.
ENABLE	3	I	ENABLE Input. The device turns off, the output disconnects from the input, and the supply current decreases to 0.05 µA when ENABLE is a logic low. ENABLE High may only be applied when VIN is inside the recommended operating range.
FB	4	I	FEEDBACK input. Connect FB to OUT as close to the load as possible to achieve best regulation. Resistive divider is on-chip to match internal reference voltage of 1.22 V.
GND	1, 20		GROUND. Analog ground for internal reference and control circuitry. Connect to PGND through a short trace.
IN	7, 14	I	Supply Input. Connect to an input supply in the 2.7-V to 5.4-V range. Bypass IN to GND with a (C_O/2) µF capacitor. Connect both INs through a short trace.
OUT	5, 16	O	Regulated 5-V power output. Connect both OUTs through a short trace and bypass OUT to GND with the output filter capacitor C_O.
PGND	9−12		PGND power ground. Charge-pump current flows through this pin. Connect all PGNDs together.
SKIP	17	I	Mode selection. When SKIP is logic low, the charge pump operates in constant-frequency mode. Output ripple and noise are minimized in this mode. When SKIP is connect to IN, the device operates in pulse skip mode. Quiescent current is lowest in this mode.
SYNC	2	I	Selection for external clock signal. Connect to GND to use the internally generated clock signal. Connect to IN for external synchronization. In this case, the clock signal needs to be fed through CLK.
PowerPAD™			Must be soldered to achieve appropriate power dissipation. Should be connected to PGND.

absolute maximum ratings (unless otherwise noted)†‡

Input voltage range, V_I (IN, OUT, ENABLE, SKIP, COM, CLK, FB, SYNC) . . . . . −0.3 V to 5.5 V

detailed description

operating principle

The TPS60110 charge pump provides a regulated 5-V output from a 2.7-V to 5.4-V input. It delivers a maximum load current of 300 mA. Designed specifically for space critical battery powered applications, the complete charge pump circuit requires only four external capacitors. The circuit can be optimized for highest efficiency at light loads or lowest output noise. The TPS60110 consists of an oscillator, a 1.22-V bandgap reference, an internal resistive feedback circuit, an error amplifier, high current MOSFET switches, a shutdown/start-up circuit, and a control circuit (Figure 23)

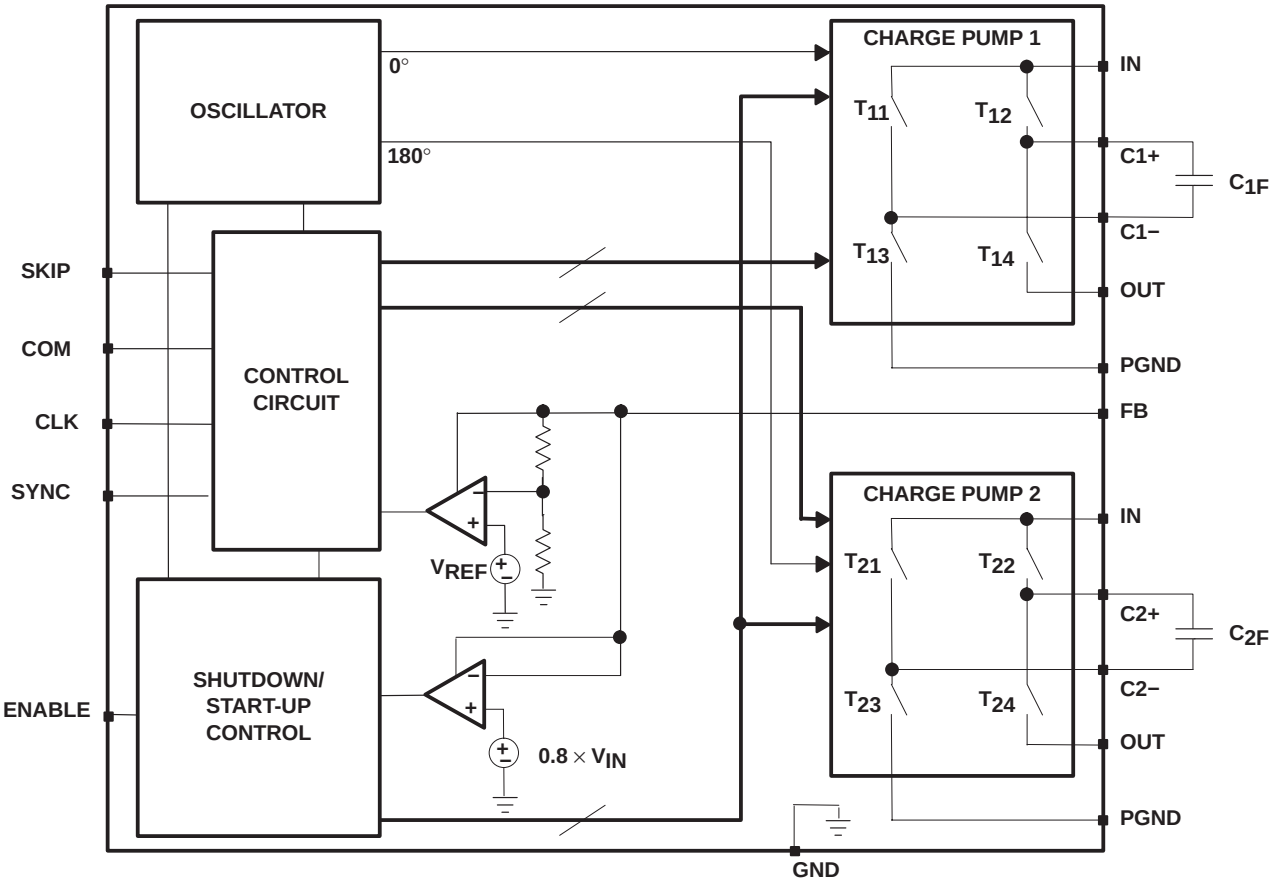

Figure 23. Functional Block Diagram TPS60110

The oscillator runs at a 50% duty cycle. The device consists of two single-ended charge pumps which operate with 180° phase shift. Each single ended charge pump transfers charge into its transfer capacitor (C_{xF}) in one half of the period. During the other half of the period (transfer phase), C_{xF} is placed in series with the input to transfer its charge to C_O. While one single-ended charge pump is in the charge phase, the other one is in the transfer phase. This operation specifies an almost constant output current which ensures a low output ripple.

If the clock were to run continuously, this process would eventually generate an output voltage equal to two times the input voltage (hence the name doubler). In order to provide a regulated fixed output voltage of 5 V, the TPS60110 uses either pulse-skip mode or constant-frequency mode. Pulse-skip mode and constant-frequency mode are externally selected via the SKIP input pin.

detailed description (continued)

start-up procedure

During start-up, i.e. when ENABLE is set from logic low to logic high, the switches T12 and T14 (charge pump 1), and the switches T22 and T24 (charge pump 2) are conducting to charge up the output capacitor until the output voltage V_O reaches $0.8 \times V_{IN}$. When the start-up comparator detects this limit, the IC begins to operate in the mode selected with SKIP and COM. This start-up charging of the output capacitor specifies a short start-up time and eliminates the need for a Schottky diode between IN and OUT.

pulse-skip mode

In pulse-skip mode (SKIP = high), the error amplifier disables switching of the power stages when it detects an output higher than 5 V. The oscillator halts. The IC then skips switching cycles until the output voltage drops below 5 V. Then the error amplifier reactivates the oscillator and switching of the power stages starts again. The pulse-skip regulation mode minimizes operating current because it does not switch continuously and deactivates all functions except bandgap reference and error amplifier when the output is higher than 5 V. When switching is disabled from the error amplifier, the load is also isolated from the input. SKIP is a logic input and should not remain floating. The typical operating circuit of the TPS60110 in pulse skip mode is shown in Figure 1.

constant-frequency mode

When SKIP is low, the charge pump runs continuously at the frequency f_{OSC}. The control circuit, fed from the error amplifier, controls the charge on C_{1F} and C_{2F} by driving the gates of the FETs T_{12}/T_{13} and T_{22}/T_{23}, respectively. When the output voltage falls, the gate drive increases, resulting in a larger voltage across C_{1F} and C_{2F}. This regulation scheme minimizes output ripple. Since the device switches continuously, the output noise contains well-defined frequency components, and the circuit requires smaller external capacitors for a given output ripple. However, constant-frequency mode, due to higher operating current, is less efficient at light loads than pulse-skip mode.

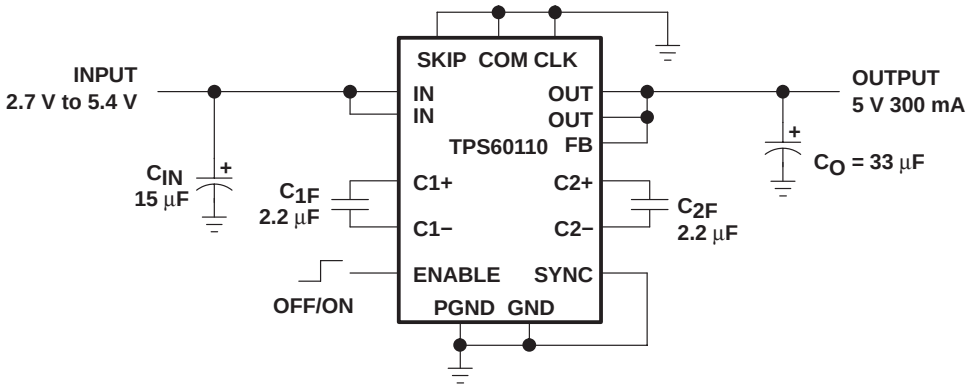

Figure 24. Typical Operating Circuit TPS60110 in Constant Frequency Mode

Table 1. Tradeoffs Between Operating Modes

FEATURE	PULSE-SKIP MODE (SKIP = High)	CONSTANT-FREQUENCY MODE (SKIP = Low)
Best light-load efficiency	X	
Smallest external component size for a given output ripple		X
Output ripple amplitude	Small amplitude	Very small amplitude
Output ripple frequency	Variable	Constant
Load regulation	Very good	Good

NOTE: Even in pulse-skip mode the output ripple amplitude is small if the push-pull operating mode is selected via COM.

detailed description (continued)

push-pull operating mode

In push-pull operating mode (COM = low), the two single-ended charge pumps operate with 180° phase shift. The oscillator signal has a 50% duty cycle. Each single-ended charge pump transfers charge into its transfer capacitor (C_{xF}) in one-half of the period. During the other half of the period (transfer phase), C_{xF} is placed in series with the input to transfer its charge to C_O. While one single-ended charge pump is in the charge phase, the other one is in the transfer phase. This operation specifies an almost constant output current which ensures a low output ripple. COM is a logic input and should not remain floating. The typical operating circuit of the TPS60110 in push-pull mode is shown in Figure 1 and Figure 24.

single-ended operating mode

When COM is high, the device runs in single-ended operating mode. The two single-ended charge pumps operate in parallel without phase shift. They transfer charge into the transfer capacitor (C_F) in one half of the period. During the other half of the period (transfer phase), C_F is placed in series with the input to transfer its charge to C_O. In single-ended operating mode only one transfer capacitor ($C_F = C_{1F} + C_{2F}$) is required, resulting in less board space.

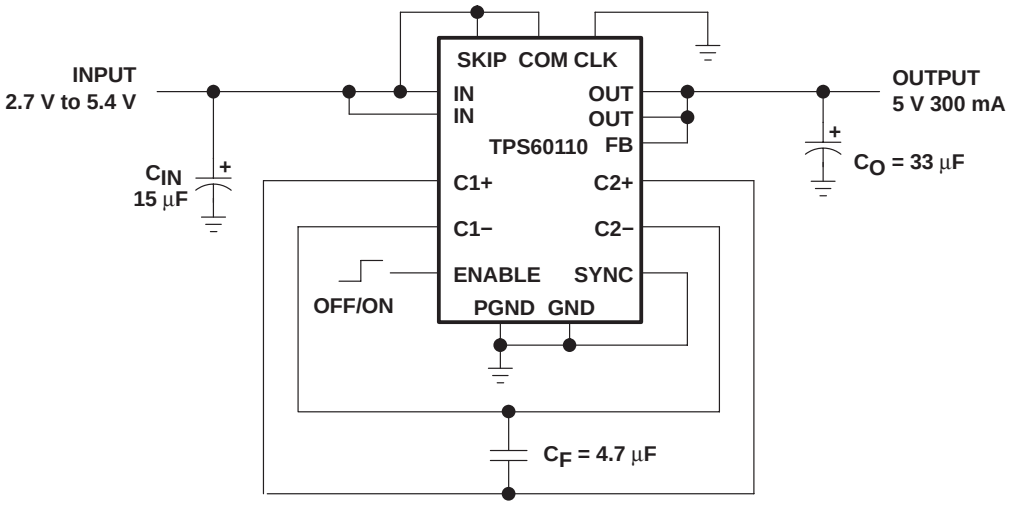

Figure 25. Typical Operating Circuit TPS60110 in Single-Ended Operating Mode

Table 2. Tradeoffs Between Operating Modes

FEATURE	PUSH-PULL MODE (COM = Low)	SINGLE-ENDED MODE (COM = High)
Output ripple amplitude	Small amplitude	Large amplitude
Smallest board space		X

detailed description (continued)

shutdown

Driving ENABLE low places the device in shutdown mode. This disables all switches, the oscillator, and control logic. The device typically draws 0.05-μA (1-μA max) of supply current in this mode. Leakage current drawn from the output is as low as 1 μA max. The device exits shutdown once ENABLE is high. The typical no-load shutdown exit time is 20 μs. When the device is in shutdown, the load is isolated from the input and the output is high impedance.

external clock signal

If the device operates at a user defined frequency, an external clock signal can be used. Therefore, SYNC needs to be connected to IN and the external oscillator signal can drive CLK. The maximum external frequency is limited to 800 kHz. The switching frequency of the converter is half of the external oscillator frequency. It is recommended to operate the charge pump in constant-frequency mode if an external clock signal is used so that the output noise contains only well-defined frequency components.

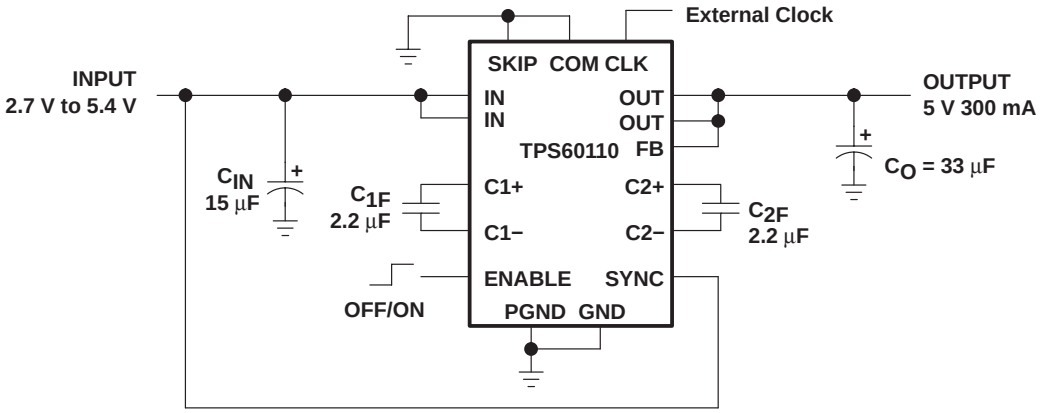

Figure 26. Typical Operating Circuit TPS60110 With External Synchronization

APPLICATION INFORMATION

capacitor selection

The TPS60110 requires only four external capacitors as shown in the basic application circuit. Their values are closely linked to the output current capacity, output noise requirements, and mode of operation. Generally, the transfer capacitors (C_{xF}) is the smallest.

The input capacitor improves system efficiency by reducing the input impedance and stabilizes the input current. C_{IN} is recommended to be about two to four times as large as C_{xF}.

The output capacitor (C_O) can be selected from 8-times to 50-times larger than C_{xF}, depending on the mode of operation and ripple tolerance†. Tables 3 and 4 show capacitor values recommended for low quiescent-current operation (pulse-skip mode) and for low output voltage ripple operation (constant-frequency mode). A recommendation is given for smallest size.

**Table 3. Recommended Capacitor Values for Low Quiescent-Current Operation†
(pulse-skip mode)**

V_{IN} [V]	I_O [mA]	C_{IN} [µF]		C_{xF} [µF]	C_O [µF]		OUTPUT VOLTAGE RIPPLE V_{PP} [mV]
		TANTALUM	CERAMIC		TANTALUM	CERAMIC

3.6	225		4.7 + 10, (X5R)	2.2		22 + 10, (X5R)	55
3.6	300	15		2.2	33		135
3.6	300		4.7 + 10, (X5R)	2.2		22 + 10, (X5R)	75

† All measurements are done with additional 1-µF X7R ceramic capacitors at input and output.

**Table 4. Recommended Capacitor Values for Low Output Voltage Ripple Operation†
(constant-frequency mode)**

V_{IN} [V]	I_O [mA]	C_{IN} [µF]		C_{xF} [µF]	C_O [µF]		OUTPUT VOLTAGE RIPPLE V_{PP} [mV]
		TANTALUM	CERAMIC		TANTALUM	CERAMIC	
3.6	225	15		2.2	33		17
3.6	225		4.7 + 10, (X5R)	2.2		22 + 10, (X5R)	6
3.6	300	15		2.2	33		22
3.6	300		4.7 + 10, (X5R)	2.2		22 + 10, (X5R)	8

† All measurements are done with additional 1-µF X7R ceramic capacitors at input and output.

† In constant-frequency mode always select $C_O \geq 33$ µF

APPLICATION INFORMATION

For the TPS60110, the smallest board space size can be achieved using Sprague's 595D-series tantalum capacitors for input and output. However, with the trend towards high capacitance ceramic capacitors in smaller size packages, these type of capacitors might soon become competitive in size.

Table 5. Recommended Capacitors

MANUFACTURER	PART NUMBER	CAPACITANCE	TYPE

Kemet	T494−series tantalum	www.kemet.com

power dissipation

The power dissipated in the TPS60110 depends on output current and is approximated by:

$$P_{DISS} = I_O \times \left(2\,V_{IN} - V_O\right) \text{ for } I_Q << I_O$$

P_{DISS} must be less than that allowed by the package rating. See the ratings for 20-PowerPAD™ package power-dissipation limits and deratings.

APPLICATION INFORMATION

layout

All capacitors should be soldered in close proximity to the IC. A PCB layout proposal for a two-layer board is given in Figure 27. Care has been taken to connect both single-ended charge pumps symmetrically to the load to achive optimized output voltage ripple performance. The proposed layout also provides improved thermal performance as the exposed leadframe is soldered to the PCB. The bottom layer of the PCB is a ground plain only. All ground areas on the PCB should be connected. Connect ground areas on top layer to the bottom layer via through hole connections.

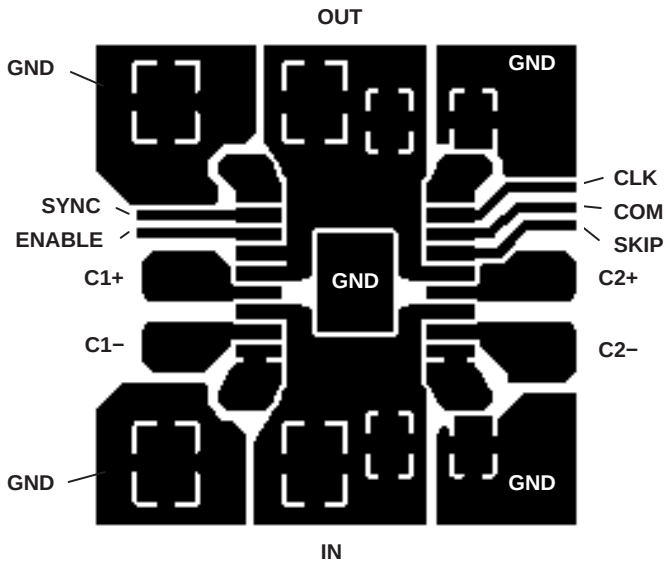

Figure 27. Recommended PCB Layout for TPS60110 (top view)

An evaluation module for the TPS60110 is available and can be ordered under literature code SLVP132 or under product code TPS60110EVM−132.

APPLICATION INFORMATION

applications proposals

paralleling of two TPS60110 to deliver 600 mA

The TPS60110 can be paralleled to yield higher load currents. The circuit of Figure 28 can deliver 600 mA at an output voltage of 5 V. It uses two TPS60110 devices in parallel. The devices can share the output capacitors, but each one requires its own transfer capacitors and input capacitor. For best performance, the paralleled devices should operate in the same mode (pulse-skip or constant frequency).

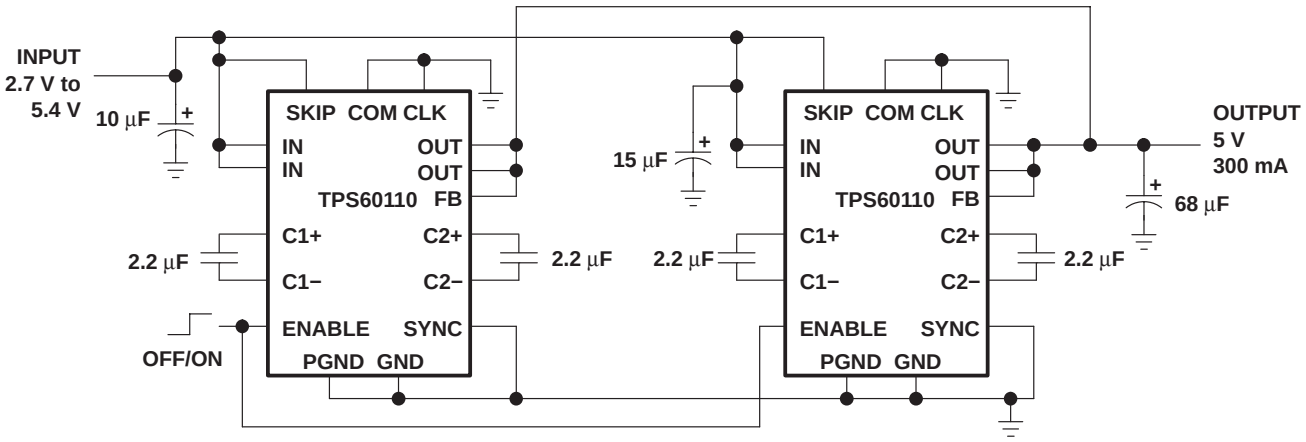

Figure 28. Paralleling of Two TPS60110

TPS60110 with LC output filter for ultra low ripple

For applications where extremely low output ripple is required, a small LC filter is recommended. This is shown in Figure 29. The addition of a small inductor and filter capacitor will reduce the output ripple well below what could be achieved with capacitors alone. The corner frequency of 500 kHz was chosen above the 300 kHz switching frequency to avoid loop stability issues in case the feedback is taken from the output of the LC filter. Leaving the feedback (FB) connection point before the LC filter, the filter capacitance value can be increased to achieve even higher ripple attenuation without affecting stability margin.

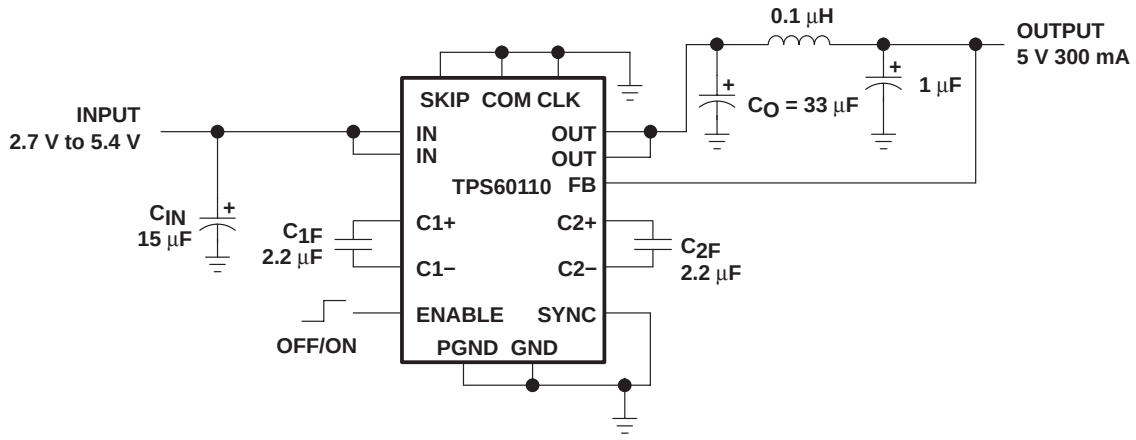

Figure 29. TPS60110 With LC Filter for Ultra Low Output Ripple Applications

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

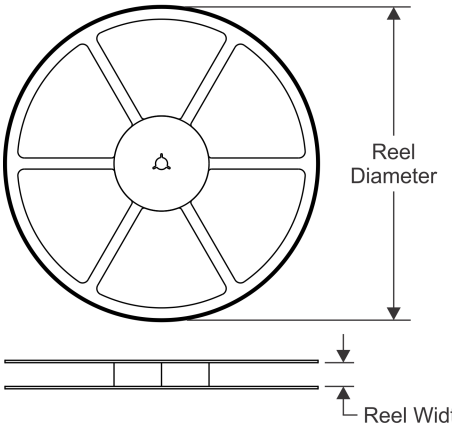
(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

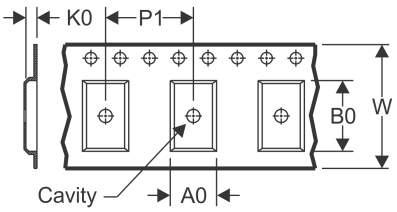
(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

TAPE AND REEL INFORMATION

REEL DIMENSIONS



TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

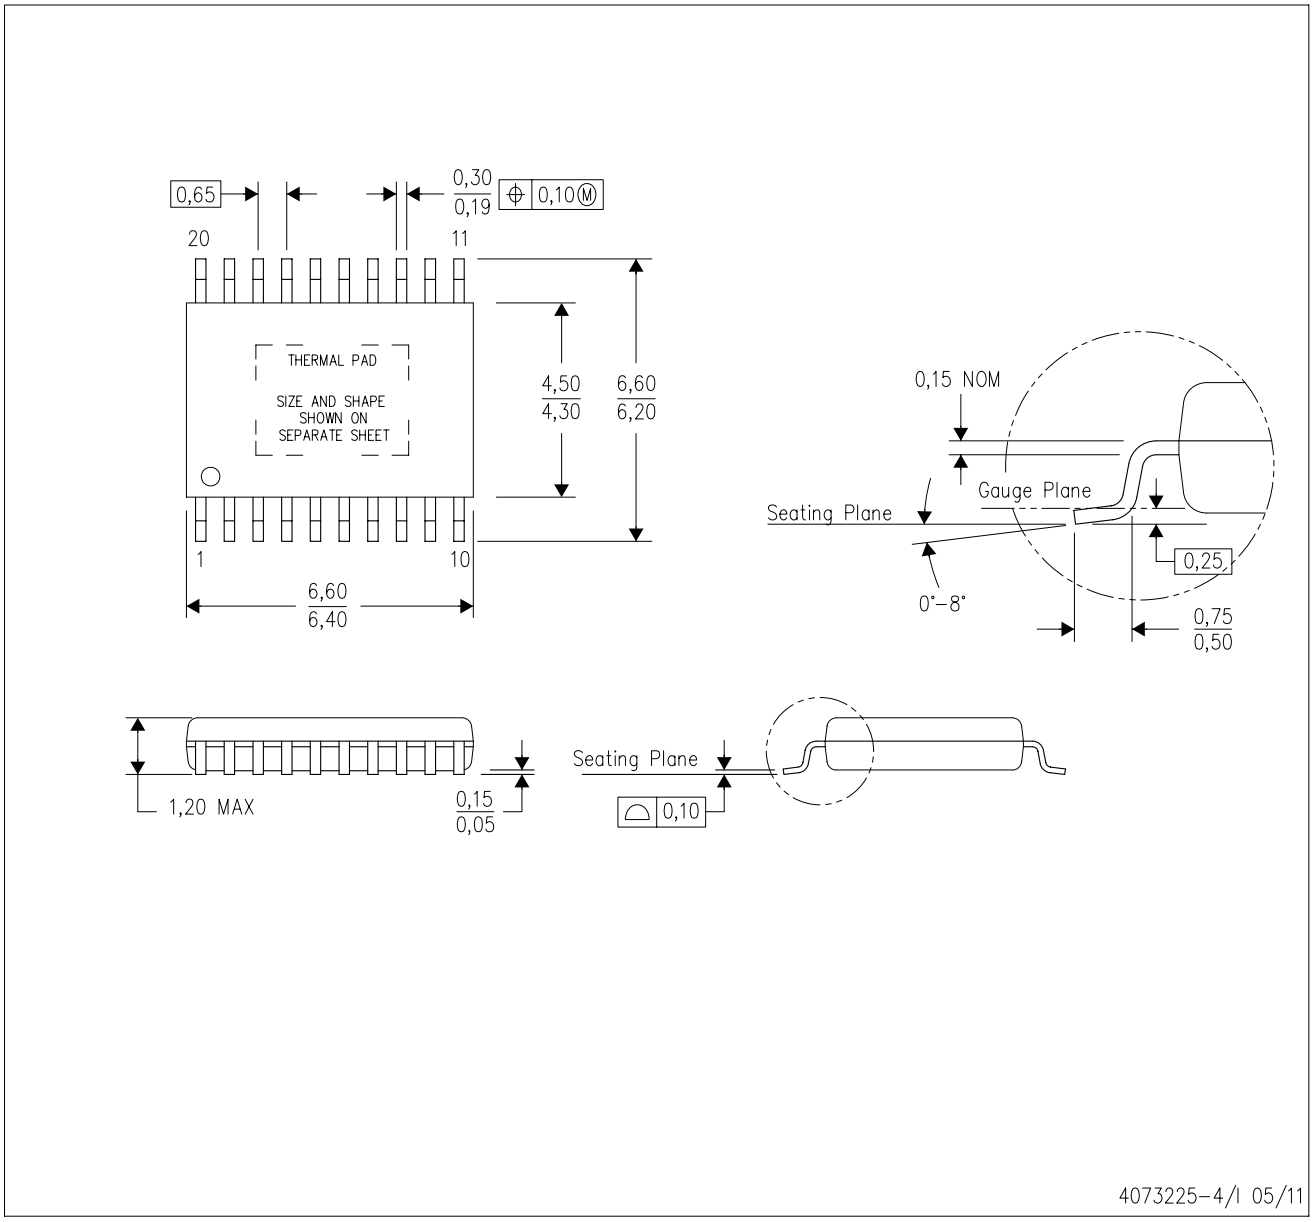
PWP (R–PDSO–G20) PowerPAD™ PLASTIC SMALL OUTLINE



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusions. Mold flash and protrusion shall not exceed 0.15 per side.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <http://www.ti.com>.
E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
E. Falls within JEDEC MO–153

PWP (R–PDSO–G20) PowerPAD™ SMALL PLASTIC OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>. Publication IPC–7351 is recommended for alternate designs.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC–7525 for other stencil recommendations.
F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
