Note:

- #1 These terminals are for 3-terminals regulators (μPC7818H, μPC7918H) as μPC1224H power supply.
- #2 These terminals are for JP—lines to a temperature Compensation transistor (2SD414 or others).
- #3 Use 0.02 μF capacitance in case of using μPC1237H at latching function, while connect each other at automatic resetting.
- #4 This capacitance is for preventing POP ON/OFF noise.
- #5 Thus, neglect it in case of using a relay. These terminals are for JP—lines in case of using the same power supply (μPC1237H and Power Amplifier)
- #6 These terminals are for JP—lines in case of using the same power supply (μPC1225H and Power Tr)
- #7 This terminal is for AC-OFF Detection. Thus, use 8.2 k ohms instead of 22 k ohms, neglect 1SS53 and connect these 1SS53's terminals and neglect 4.7 μF in case of using DC power supply.
- #8 These capacitances are for preventing a parasitic oscillation. Use a 0.1 μF.
- #9 These trimmers are for adjusting an idling current. Recommend Neo-Pot P581 Series.
- #10 These capacitance are for the 3-terminals regulator input.
- #11 Design of 1 μH (example)

- #12 This indicates a copper board pattern
- This is the evaluation circuit. Thus, it is not for a mass production considered about component deviation and the temperature characteristic.
