LMC6035/LMC6035-Q1/LMC6036 Low Power 2.7V Single Supply CMOS Operational Amplifiers

Check for Samples: LMC6035, LMC6036

FEATURES

- (Typical Unless Otherwise Noted)
- LMC6035 in DSBGA Package
- Ensured 2.7V, 3V, 5V and 15V Performance
- Specified for 2 k Ω and 600 Ω Loads
- Wide Operating Range: 2.0V to 15.5V
- Ultra Low Input Current: 20fA
- **Rail-to-Rail Output Swing**
 - @ 600Ω: 200mV from Either Rail at 2.7V
 - @ 100kΩ: 5mV from Either Rail at 2.7V
- High Voltage Gain: 126dB
- Wide Input Common-Mode Voltage Range
 - -0.1V to 2.3V at V_S = 2.7V
- Low Distortion: 0.01% at 10kHz
- LMC6035 Dual LMC6036 Quad
- See AN-1112 (Literature Number SNVA009) for **DSBGA Considerations**
- AEC-Q100 Grade 3 Qualified (LMC6035-Q1)

APPLICATIONS

- Filters •
- **High Impedance Buffer or Preamplifier**
- **Battery Powered Electronics**
- Medical Instrumentation

Automotive Applications DESCRIPTION

The LMC6035/6 is an economical, low voltage op amp capable of rail-to-rail output swing into loads of 600Ω. LMC6035 is available in a chip sized package (8-Bump DSBGA) using micro SMD package technology. Both allow for single supply operation and are ensured for 2.7V, 3V, 5V and 15V supply voltage. The 2.7 supply voltage corresponds to the End-of-Life voltage (0.9V/cell) for three NiCd or NiMH batteries in series, making the LMC6035/6 well suited for portable and rechargeable systems. It also features a well behaved decrease in its specifications at supply voltages below its ensured 2.7V operation. This provides a "comfort zone" for adequate operation at voltages significantly below 2.7V. Its ultra low input currents (I_{IN}) makes it well suited for low power active filter application, because it allows the use of higher resistor values and lower capacitor values. In addition, the drive capability of the LMC6035/6 gives these op amps a broad range of applications for low voltage systems.

| C2 | V ⁻ | IN A ⁻ |
| C3 | IN B ⁺ | IN A ⁺ |
| B3 | IN B ⁻ | V ⁻ |
| A3 | OUTPUT B | IN B ⁺ |
| A2 | V* | IN B [−] |

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings⁽¹⁾⁽²⁾

| ESD Tolerance ⁽³⁾ | Human Body Model (LMC6035, LMC6036) | 3000V |
|---|-------------------------------------|--------------------|
| | Human Body Model (LMC6035-Q1) | 2000V |
| | Machine Model | 300V |
| Differential Input Voltage | | ± Supply Voltage |
| Supply Voltage (V ⁺ – V ⁻) | | 16V |
| Output Short Circuit to V + | | See ⁽⁴⁾ |
| Output Short Circuit to V | See ⁽⁵⁾ | |
| Lead Temperature (soldering, 10 sec.) | | 260°C |
| Current at Output Pin | | ±18mA |
| Current at Input Pin | | ±5mA |
| Current at Power Supply Pin | | 35mA |
| Storage Temperature Range | | −65°C to +150°C |
| Junction Temperature ⁽⁶⁾ | | 150°C |

(1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not ensured. For ensured specifications and the test conditions, see the Electrical Characteristics.

(2) If Military/Aerospace specified devices are required, please contact the TI Sales Office/ Distributors for availability and specifications.

(3) Human body model, $1.5k\Omega$ in series with 100pF.

(4) Do not short circuit output to V⁺ when V⁺ is greater than 13V or reliability will be adversely affected.

(5) Applies to both single-supply and split-supply operation. Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C. Output currents in excess of 30mA over long term may adversely affect reliability.

(6) The maximum power dissipation is a function of $T_{J(MAX)}$, θ_{JA} , and T_A . The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} - T_A)/\theta_{JA}$. All numbers apply for packages soldered directly onto a PC board with no air flow.

Operating Ratings⁽¹⁾

| Supply Voltage | | 2.0V to 15.5V |
|--------------------------------------|----------------------------|--------------------------------|
| Temperature Range | LMC6035I and LMC6036I | −40°C ≤ T _J ≤ +85°C |
| Thermal Resistance (θ_{JA}) | 8-pin VSSOP | 230°C/W |
| | 8-pin SOIC | 175°C/W |
| | 14-pin SOIC | 127°C/W |
| | 14-pin TSSOP | 137°C/W |
| | 8-Bump (6 mil) DSBGA | 220°C/W |
| | 8-Bump (12 mil) Thin DSBGA | 220°C/W |

(1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not ensured. For ensured specifications and the test conditions, see the Electrical Characteristics.

APPLICATION NOTES

Background

The LMC6035/6 is exceptionally well suited for low voltage applications. A desirable feature that the LMC6035/6 brings to low voltage applications is its output drive capability—a hallmark for TI's CMOS amplifiers. The circuit of Figure 43 illustrates the drive capability of the LMC6035/6 at 3V of supply. It is a differential output driver for a one-to-one audio transformer, like those used for isolating ground from the telephone lines. The transformer (T1) loads the op amps with about 600Ω of AC load, at 1 kHz. Capacitor C1 functions to block DC from the low winding resistance of T1. Although the value of C1 is relatively high, its load reactance (Xc) is negligible compared to inductive reactance (X₁) of T1.

Figure 43. Differential Driver

The circuit in Figure 43 consists of one input signal and two output signals. U1A amplifies the input with an inverting gain of -2, while the U1B amplifies the input with a non-inverting gain of +2. Since the two outputs are 180° out of phase with each other, the gain across the differential output is 4. As the differential output swings between the supply rails, one of the op amps sources the current to the load, while the other op amp sinks the current.

How good a CMOS op amp can sink or source a current is an important factor in determining its output swing capability. The output stage of the LMC6035/6—like many op amps—sources and sinks output current through two complementary transistors in series. This "totem pole" arrangement translates to a channel resistance (R_{dson}) at each supply rail which acts to limit the output swing. Most CMOS op amps are able to swing the outputs very close to the rails—except, however, under the difficult conditions of low supply voltage and heavy load. The LMC6035/6 exhibits exceptional output swing capability under these conditions.

The scope photos of Figure 44 and Figure 45 represent measurements taken directly at the output (relative to GND) of U1A, in Figure 43. Figure 44 illustrates the output swing capability of the LMC6035, while Figure 45 provides a benchmark comparison. (The benchmark op amp is another low voltage (3V) op amp manufactured by one of our reputable competitors.)

AV1

www.ti.com

SNOS875G - JANUARY 2000 - REVISED APRIL 2013

Not only does the LMC6035/6 provide excellent output swing capability at low supply voltages, it also maintains high open loop gain (A _{VOL}) with heavy loads. To illustrate this, the LMC6035 and the benchmark op amp were compared for their distortion performance in the circuit of Figure 43. The graph of Figure 46 shows this comparison. The y-axis represents percent Total Harmonic Distortion (THD plus noise) across the loaded secondary of T1. The x-axis represents the input amplitude of a 1 kHz sine wave. (Note that T1 loses about 20% of the voltage to the voltage divider of R_L (600 Ω) and T1's winding resistances—a performance deficiency of the transformer.)

Figure 46. THD+Noise Performance of LMC6035 and "Benchmark" per Circuit of Figure 43

Figure 46 shows the superior distortion performance of LMC6035/6 over that of the benchmark op amp. The heavy loading of the circuit causes the A_{VOL} of the benchmark part to drop significantly which causes increased distortion.

APPLICATION CIRCUITS

Low-Pass Active Filter

A common application for low voltage systems would be active filters, in cordless and cellular phones for example. The ultra low input currents $(I_{\rm IN})$ of the LMC6035/6 makes it well suited for low power active filter applications, because it allows the use of higher resistor values and lower capacitor values. This reduces power consumption and space.

Figure 47 shows a low pass, active filter with a Butterworth (maximally flat) frequency response. Its topology is a Sallen and Key filter with unity gain. Note the normalized component values in parenthesis which are obtainable from standard filter design handbooks. These values provide a 1Hz cutoff frequency, but they can be easily scaled for a desired cutoff frequency (f_c). The bold component values of Figure 47 provide a cutoff frequency of 3kHz. An example of the scaling procedure follows Figure 47.

Figure 47. 2-Pole, 3kHz, Active, Sallen and Key, Lowpass Filter with Butterworth Response

Low-Pass Frequency Scaling Procedure

The actual component values represented in bold of Figure 47 were obtained with the following scaling procedure:

- 1. First determine the frequency scaling factor (FSF) for the desired cutoff frequency. Choosing f_c at 3kHz, provides the following FSF computation:
 - FSF = $2\pi \times 3$ kHz (desired cutoff freq.) = 18.84 x 10³
- 2. Then divide all of the normalized capacitor values by the FSF as follows: $C1' = C_{(Normalized)}/FSF$ $C1' = 0.707/18.84 \times 10^3 = 37.93 \times 10^{-6}$ $C2' = 1.414/18.84 \times 10^3 = 75.05 \times 10^{-6}$ (C1' and C2': prior to impedance scaling)
- 3. Last, choose an impedance scaling factor (Z). This Z factor can be calculated from a standard value for C2. Then Z can be used to determine the remaining component values as follows:

 $Z = C2'/C2_{(chosen)} = 75.05 \text{ x } 10^{-6}/6.8 \text{nF} = 8.4 \text{k}$

 $C1 = C1'/Z = 37.93 \times 10^{-6} / 8.4 k = 4.52 nF$

(Standard capacitor value chosen for C1 is**4.7nF** $) \quad R1 = R1_{(normalized)} \ x \ Z = 1\Omega \ x \ 8.4k = 8.4k\Omega \quad R2 = R2_{(normalized)} \ x \ Z = 1\Omega \ x \ 8.4k = 8.4k\Omega \quad R2 = R1_{(normalized)} \ x \ Z = R1_{(normalized)}$

(Standard value chosen for R1 and R2 is $8.45k\Omega$)

High Pass Active Filter

The previous low-pass filter circuit of Figure 47 converts to a high-pass active filter per Figure 48.

Figure 48. 2 Pole, 300Hz, Sallen and Key, High-Pass Filter

High-Pass Frequency Scaling Procedure

Choose a standard capacitor value and scale the impedances in the circuit according to the desired cutoff frequency (300Hz) as follows: C = C1 = C2 Z = 1 Farad/ $C_{(chosen)} \times 2\pi \times (desired cutoff freq.) = 1$ Farad/**6.8nF** x $2\pi \times 300$ Hz = 78.05k

 $R1 = Z \times R1_{(normalized)} = 78.05k \times (1/0.707) = 110.4k\Omega$

(Standard value chosen for R1 is $110k\Omega$)

 $R2 = Z \times R2_{(normalized)} = 78.05k \times (1/1.414) = 55.2k\Omega$

(Standard value chosen for R1 is 54.9kΩ)

Dual Amplifier Bandpass Filter

The dual amplifier bandpass (DABP) filter features the ability to independently adjust f_c and Q. In most other bandpass topologies, the f_c and Q adjustments interact with each other. The DABP filter also offers both low sensitivity to component values and high Qs. The following application of Figure 49, provides a 1kHz center frequency and a Q of 100.

LMC6035, LMC6035-Q1, LMC6036

SNOS875G – JANUARY 2000 – REVISED APRIL 2013

www.ti.com

Figure 49. 2 Pole, 1kHz Active, Bandpass Filter

DABP Component Selection Procedure

Component selection for the DABP filter is performed as follows:

- 1. First choose a center frequency (f_c). Figure 49 represents component values that were obtained from the following computation for a center frequency of 1kHz. R2 = R3 = 1/(2 π f _cC) Given: f_c = 1kHz and C _(chosen) = **6.8nF** R2 = R3 = 1/(2\pi x 3kHz x 6.8nF) = 23.4kΩ
 - (Chosen standard value is 23.7kΩ)
- 2. Then compute R1 for a desired Q (f_c /BW) as follows: R1 = Q x R2. Choosing a Q of 100, R1 = 100 x 23.7k Ω = **2.37M\Omega.**

PRINTED-CIRCUIT-BOARD LAYOUT FOR HIGH-IMPEDANCE WORK

It is generally recognized that any circuit which must operate with < 1000pA of leakage current requires special layout of the PC board. If one wishes to take advantage of the ultra-low bias current of the LMC6035/6, typically < 0.04pA, it is essential to have an excellent layout. Fortunately, the techniques for obtaining low leakages are quite simple. First, the user must not ignore the surface leakage of the PC board, even though it may at times appear acceptably low. Under conditions of high humidity, dust or contamination, the surface leakage will be appreciable.

To minimize the effect of any surface leakage, lay out a ring of foil completely surrounding the LMC6035 or LMC6036 inputs and the terminals of capacitors, diodes, conductors, resistors, relay terminals, etc. connected to the op amp's inputs. See Figure 50. To have a significant effect, guard rings should be placed on both the top and bottom of the PC board. This PC foil must then be connected to a voltage which is at the same voltage as the amplifier inputs, since no leakage current can flow between two points at the same potential. For example, a PC board trace-to-pad resistance of $10^{12}\Omega$, which is normally considered a very large resistance, could leak 5pA if the trace were a 5V bus adjacent to the pad of an input. This would cause a 100 times degradation from the amplifiers actual performance. However, if a guard ring is held within 5mV of the inputs, then even a resistance of $10^{11}\Omega$ would cause only 0.05pA of leakage current, or perhaps a minor (2:1) degradation of the amplifier's performance. See Figure 51(a) through Figure 51(c) for typical connections of guard rings for standard op amp configurations. If both inputs are active and at high impedance, the guard can be tied to ground and still provide some protection; see Figure 51(d).

SNOS875G - JANUARY 2000 - REVISED APRIL 2013

Figure 50. Example, using the LMC6036 of Guard Ring in PC Board Layout

CAPACITIVE LOAD TOLERANCE

Like many other op amps, the LMC6035/6 may oscillate when its applied load appears capacitive. The threshold of oscillation varies both with load and circuit gain. The configuration most sensitive to oscillation is a unity-gain follower. See the Typical Performance Characteristics.

SNOS875G - JANUARY 2000 - REVISED APRIL 2013

The load capacitance interacts with the op amp's output resistance to create an additional pole. If this pole frequency is sufficiently low, it will degrade the op amp's phase margin so that the amplifier is no longer stable at low gains. As shown in Figure 52, the addition of a small resistor $(50\Omega-100\Omega)$ in series with the op amp's output, and a capacitor (5pF-10pF) from inverting input to output pins, returns the phase margin to a safe value without interfering with lower-frequency circuit operation. Thus, larger values of capacitance can be tolerated without oscillation. Note that in all cases, the output will ring heavily when the load capacitance is near the threshold for oscillation.

DSBGA Considerations

Contrary to what might be guessed, the DSBGA package does not follow the trend of smaller packages having higher thermal resistance. LMC6035 in DSBGA has thermal resistance of 220°C/W compared to 230°C/W in VSSOP. Even when driving a 600 Ω load and operating from ±7.5V supplies, the maximum temperature rise will be under 4.5°C. For application information specific to DSBGA, see Application note AN-1112 (Literature Number SNVA009).

Figure 52. Rx, Cx Improve Capacitive Load Tolerance

Capacitive load driving capability is enhanced by using a pull up resistor to V^+ (Figure 53). Typically a pull up resistor conducting 500µA or more will significantly improve capacitive load responses. The value of the pull up resistor must be determined based on the current sinking capability of the amplifier with respect to the desired output swing. Open loop gain of the amplifier can also be affected by the pull up resistor (see Electrical Characteristics).

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

PACKAGE OPTION ADDENDUM

26-Sep-2017

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's noncompliance with the terms and provisions of this Notice.
