# Dual, 12-Bit, $3+3$ or 2+2 Channel, Simultaneous Sampling Analog-to-Digital Converter 

Check for Samples: ADS7865

## FEATURES

- Six Pseudo- or Four Fully Differential Inputs
- SNR: 71.7dB, THD: -87dB
- Programmable Channel Sequencer
- Programmable and Buffered Internal 2.5V Reference
- Flexible Power-Down Features
- Variable Power-Supply Ranges: 2.7 V to 5.5 V
- Low-Power Operation: 44mW Maximum at 5V
- Operating Temperature Range: $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
- Pin-Compatible Upgrade for the ADS7862

## APPLICATIONS

- Motor Control
- Multi-Axis Positioning Systems
- Three-Phase Power Control

## DESCRIPTION

The ADS7865 is a dual, 12-bit, 2MSPS analog-todigital converter (ADC) with four fully differential or six pseudo-differential input channels grouped into two pairs for high-speed, simultaneous signal acquisition. Inputs to the sample-and-hold ( $\mathrm{S} / \mathrm{H}$ ) amplifiers are fully differential and are maintained differentially to the input of the ADC. This architecture provides excellent common-mode rejection of 72 dB at 100 kHz , which is a critical performance characteristic in noisy environments.
The ADS7865 is pin-compatible with the ADS7862, but offers additional features such as a programmable channel sequencer and reference output, flexible supply voltage ( 2.7 V to 5.5 V for $\mathrm{AV}_{\mathrm{DD}}$ and $B V_{D D}$ ), a pseudo-differential input multiplexer with three channels per ADC, and several power-down features.
The ADS7865 is offered in a TQFP-32 package. It is specified over the extended operating temperature range of $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$.

[^0]This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.
ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## ORDERING INFORMATION

For the most current package and ordering information, see the Package Option Addendum at the end of this document, or visit the device product folder at www.ti.com.

## ABSOLUTE MAXIMUM RATINGS ${ }^{(1)}$

Over operating free-air temperature range, unless otherwise noted.

|  |  | ADS7865 | UNIT |
| :---: | :---: | :---: | :---: |
| Supply voltag | to AGND | -0.3 to +6 | V |
| Supply voltag | to BGND | -0.3 to +6 | V |
| Supply voltag | to $A V_{D D}$ | $1.5 \times$ AVDD | V |
| Analog and re | ce input voltage with respect to AGND | AGND - 0.3 to AVDD + 0.3 | V |
| Digital input | with respect to BGND | BGND - 0.3 to BVDD + 0.3 | V |
| Ground voltag | erence \|AGND - BGND| | 0.3 | V |
| Input current | pins except power-supply pins | -10 to +10 | mA |
| Maximum virtua | nction temperature, $\mathrm{T}_{J}$ | +150 | ${ }^{\circ} \mathrm{C}$ |
| ESD | Human body model (HBM), JEDEC standard 22, test method A114-C.01, all pins | $\pm 4000$ | V |
| ESD rating | Charged device model (CDM), JEDEC standard 22, test method C101, all pins | $\pm 1500$ | V |

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.

## RECOMMENDED OPERATING CONDITIONS

Over operating free-air temperature range, unless otherwise noted.

| PARAMETER |  | ADS7865 |  |  | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | MIN | NOM | MAX |  |
| Supply voltage, $\mathrm{AV}_{\mathrm{DD}}$ to AGND |  | 2.7 | 5.0 | 5.5 | V |
| Supply voltage, $\mathrm{BV}_{\mathrm{DD}}$ to BGND | Low voltage levels | 2.7 |  | 3.6 | V |
|  | 5 V logic levels | 4.5 | 5.0 | 5.5 | V |
| Reference input voltage on $\mathrm{REF}_{\text {IN }}$ |  | 0.5 | 2.5 | 2.525 | V |
| Analog differential input voltage (CHXX+) - (CHXX-) |  | $-\mathrm{V}_{\text {REF }}$ |  | $+\mathrm{V}_{\text {REF }}$ | V |
| Operating ambient temperature range, $\mathrm{T}_{\mathrm{A}}$ |  | -40 |  | +125 | ${ }^{\circ} \mathrm{C}$ |

## THERMAL CHARACTERISTICS ${ }^{(1)}$

Over operating free-air temperature range, unless otherwise noted.

| PARAMETER |  | High-K thermal resistance | ADS7865 | UNIT |
| :--- | :--- | :--- | :---: | :---: |
| $\theta_{\mathrm{JA}}$ | Junction-to-air thermal resistance |  | 56.4 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\theta_{\mathrm{JC}}$ | Junction-to-case thermal resistance |  | 20.8 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{P}_{\mathrm{D}}$ | Device power dissipation at AVDD $=5 \mathrm{~V}$ and BVDD $=3.3 \mathrm{~V}$ |  | 44 | mW |

## EQUIVALENT INPUT CIRCUIT

## DEVICE INFORMATION

TERMINAL FUNCTIONS

| PIN NUMBER | NAME | DESCRIPTION |
| :---: | :---: | :---: |
| 1 | REFIN | Reference voltage input. A ceramic capacitor of $470 \mathrm{nF}(\mathrm{min})$ is required at this terminal. |
| 2 | REFOUT | Reference voltage output. The programmable internal voltage reference output is available on this pin. |
| 3 | AGND | Analog ground. Connect to analog ground plane. |
| 4 | $\mathrm{AV}_{\mathrm{DD}}$ | Analog power supply, 2.7V to 5.5 V . Decouple to AGND with a $1 \mu \mathrm{~F}$ ceramic capacitor. |
| 5 | DB11 | Data bit 11, MSB |
| 6 | DB10 | Data bit 10 |
| 7 | DB9 | Data bit 9 |
| 8 | DB8 | Data bit 8 |
| 9 | DB7 | Data bit 7 |
| 10 | DB6 | Data bit 6 |
| 11 | DB5 | Data bit 5 |
| 12 | DB4 | Data bit 4 |
| 13 | DB3 | Data bit 3 |
| 14 | DB2 | Data bit 2 |
| 15 | DB1 | Data bit 1 |
| 16 | DB0 | Data bit 0 |
| 17 | BUSY | ADC busy indicator. BUSY goes high when the inputs are in hold mode and returns to low after the conversion has been finished. |
| 18 | CONVST | Conversion start. The ADC switches from the sample into the hold mode on the falling edge of CONVST, independent of the status of the CLOCK. The conversion itself starts with the next rising edge of CLOCK. |
| 19 | CLOCK | External clock input. |
| 20 | $\overline{\mathrm{CS}}$ | Chip select. When low, the parallel interface of the device is active; when high, input signals are ignored and output signals are 3 -state. |
| 21 | $\overline{\mathrm{RD}}$ | Read data. Falling edge active synchronization pulse for the parallel data outputs. $\overline{\mathrm{RD}}$ only triggers, when $\overline{\mathrm{CS}}$ is low. |
| 22 | $\overline{\text { WR }}$ | Write data. Rising edge latches in the parallel data inputs. $\overline{\mathrm{WR}}$ only triggers, when $\overline{\mathrm{CS}}$ is low. |

TERMINAL FUNCTIONS (continued)

| PIN NUMBER | NAME |  |
| :---: | :---: | :--- |
| 23 | BGND | Buffer I/O ground. Connect to digital ground plane. |
| 24 | BV DD $^{2}$ | Buffer I/O power supply, 2.7V to 5.5V. Decouple to BGND with a $1 \mu$ F ceramic capacitor. |
| 25 | CHB1+ | Noninverting analog input channel B1 |
| 26 | CHB1- | Inverting analog input channel B1 |
| 27 | CHB0 + | Noninverting analog input channel B0 |
| 28 | CHB0- | Inverting analog input channel B0 |
| 29 | CHA1- | Inverting analog input channel A1 |
| 30 | CHA1+ | Noninverting analog input channel A1 |
| 31 | CHA0- | Inverting analog input channel A0 |
| 32 | CHA0+ | Noninverting analog input channel A0 |

TIMING CHARACTERISTICS

| tclkL | CLOCK low time |  | 9.4 |  |  | ns |
| $\mathrm{t}_{\text {CLKH }}$ | CLOCK high time |  | 9.4 |  |  | ns |
| $\mathrm{t}_{1}$ | CONVST low time |  | 20 |  |  | ns |
| $\mathrm{t}_{2}$ | $\overline{\text { CONVST }}$ falling edge to BUSY high delay ${ }^{(2)}$ |  | 3 |  |  | ns |
| $\mathrm{t}_{3}$ | CONVST high time |  | 20 |  |  | ns |
| $\mathrm{t}_{4}$ | $\overline{\mathrm{RD}}$ falling edge to BUSY high setup time |  | 1 |  |  | $\mathrm{t}_{\text {CLK }}$ |
| $\mathrm{t}_{5}$ | 14th CLOCK rising edge to BUSY low delay |  | 3 |  |  | ns |
| $\mathrm{t}_{6}$ | $\overline{\mathrm{CS}}$ falling edge to $\overline{\mathrm{RD}}$ or $\overline{\mathrm{WR}}$ falling edge setup time |  | 0 |  |  | ns |
| $\mathrm{t}_{7}$ | $\overline{\mathrm{CS}}$ rising edge to $\overline{\mathrm{RD}}$ or $\overline{\mathrm{WR}}$ rising edge hold time |  | 0 |  |  | ns |
| $\mathrm{t}_{8}$ | $\overline{\mathrm{WR}}$ low time |  | 10 |  |  | ns |
| $\mathrm{t}_{9}$ | $\overline{\mathrm{RD}}$ high time between two read accesses |  | 10 |  |  | ns |
| $\mathrm{t}_{10}$ | $\overline{\mathrm{RD}}$ falling edge to output data valid delay |  |  |  | 20 | ns |
| $\mathrm{t}_{11}$ | Output data hold time |  | 5 |  |  | ns |
| $\mathrm{t}_{12}$ | Input data setup time |  | 10 |  |  | ns |
| $\mathrm{t}_{13}$ | Input data hold time |  | 5 |  |  | ns |
| $\mathrm{t}_{14}$ | Input data still valid to $\overline{\text { CONVST }}$ falling edge setup time |  | 31.25 |  |  | ns |

(1) All input signals are specified with $t_{R}=t_{F}=1.5 \mathrm{~ns}\left(10 \%\right.$ to $90 \%$ of $\left.B V_{D D}\right)$ and timed from a voltage level of $\left(V_{I L}+V_{I H}\right) / 2$.
(2) Not applicable in auto-Nap power-down mode.

NOTE: All CONVST commands that occur more than 10ns before the rising edge of cycle ' 1 ' of the external clock (Region 'A') initiate a conversion on the rising edge of cycle ' 1 '. All CONVST commands that occur 5 ns after the rising edge of cycle ' 1 ' or 10 ns before the rising edge of cycle ' 2 ' (Region ' $B$ ') initiate a conversion on the rising edge of cycle ' 2 '. All CONVST commands that occur 5 ns after the rising edge of cycle '2' (Region ' C ') initiate a conversion on the rising edge of the next clock period.
The CONVST pin should never be switched from LOW to HIGH in the region 10 ns before the rising edge of the CLOCK and 5 ns after the rising edge (gray areas). If CONVST is toggled in this gray area, the conversion could begin on either the same rising edge of the CLOCK or the following edge.

Figure 2. CONVST Timing

## APPLICATION INFORMATION

## GENERAL DESCRIPTION

The ADS7865 includes two 12-bit analog-to-digital converters (ADCs) that operate based on the successive-approximation register (SAR) principle. The ADCs sample and convert simultaneously. Conversion time can be as low as 406.25 ns. Adding the acquisition time of 62.5 ns and an additional clock cycle for setup/hold time requirements and skew results in a maximum conversion rate of 2MSPS.
Each ADC has a fully differential 2:1 multiplexer frontend. In many common applications, all negative input signals remain at the same constant voltage (for example, 2.5 V ). In this type of application, the multiplexer can be used in a pseudo-differential 3:1 mode, where CHxO - functions as a common-mode input and the remaining three inputs ( $\mathrm{CH} \times 0+$, $\mathrm{CHx} 1-$, and $\mathrm{CH} \times 1+$ ) operate as separate inputs referred to the common-mode input.
The ADS7865 also includes a 2.5 V internal reference. The reference drives a 10-bit digital-to-analog converter (DAC), allowing the voltage at the REF pin to be adjusted via the internal DAC register in 2.44 mV steps. A low-noise operational amplifier with unity-gain buffers the DAC output voltage and drives the $\mathrm{REF}_{\text {OUt }}$ pin.
The ADS7865 offers a parallel interface that is pincompatible with the ADS7862. However, instead of the A0 pin of the ADS7862 that controls channel selection, the ADS7865 offers a write data input (WR) pin that supports additional functions described in the Digital section of this data sheet (see also the ADS7862 Compatibility section).

## ANALOG

This section discusses the analog input circuit, the ADCs, and the reference design of the device.

## Analog Inputs

Each ADC is fed by an input multiplexer, as shown in Figure 31. Each multiplexer is either used in a fullydifferential 2:1 configuration (as described in Table 1) or a pseudo-differential 3:1 configuration (as shown in Table 2). The channel selection is performed using bits C1 and C0 in the configuration register (see also the Configuration Register section).

Figure 31. Input Multiplexer Configuration

Table 1. Fully Differential 2:1 Multiplexer Configuration

| C1 | C0 | ADC+ | ADC- |
| :---: | :---: | :---: | :---: |
| 0 | 0 | $\mathrm{CH} \times 0+$ | $\mathrm{CH} \times 0-$ |
| 1 | 1 | $\mathrm{CH} \times 1+$ | $\mathrm{CH} \times 1-$ |

Table 2. Pseudo-Differential 3:1 Multiplexer Configuration

| C1 | C0 | ADC + | ADC- |
| :---: | :---: | :---: | :---: |
| 0 | 0 | $\mathrm{CH} \times 0+$ | $\mathrm{CH} \times 0-$ |
| 0 | 1 | $\mathrm{CH} \times 1-$ | $\mathrm{CH} \times 0-$ |
| 1 | 0 | $\mathrm{CH} \times 1+$ | $\mathrm{CH} \times 0-$ |

The input path for the converter is fully differential and provides a common-mode rejection of 72 dB at 100 kHz . The high CMRR also helps suppress noise in harsh industrial environments.
Each of the 2 pF sample-and-hold capacitors (shown as $\mathrm{C}_{\mathrm{S}}$ in the Equivalent Input Circuit ) is connected via switches to the multiplexer output. Opening the switches holds the sampled data during the conversion process. After finishing the conversion, both capacitors are pre-charged for the duration of one clock cycle to the voltage present at the REF ${ }_{\text {IN }}$ pin. After the pre-charging, the multiplexer outputs are connected to the sampling capacitors again. The voltage at the analog input pin is usually different from the reference voltage; therefore, the sample capacitors must be charged to within one-half LSB for 12 -bit accuracy during the acquisition time $\mathrm{t}_{\mathrm{ACQ}}$ (see the Timing Characteristics).
Acquisition time is indicated with the BUSY signal being held low. It starts by closing the input switches (after finishing the previous conversion and precharging) and finishes with the rising edge of the CONVST signal. If the ADS7865 operates at full speed, the acquisition time is typically 62.5 ns .

The minimum -3 dB bandwidth of the driving operational amplifier can be calculated as shown in Equation 1, with $n=12$ being the resolution of the ADS7865:
$f_{-3 d B}=\frac{\ln (2) \times(n+1)}{2 \pi \times t_{A C Q}}$
With $\mathrm{t}_{\mathrm{ACQ}}=62.5 \mathrm{~ns}$, the minimum bandwidth of the driving amplifier is 23 MHz . The required bandwidth can be lower if the application allows a longer acquisition time.

A gain error occurs if a given application does not fulfill the settling requirement shown in Equation 1. As a result of pre-charging the capacitors, linearity and THD are not directly affected, however.

The OPA365 from Texas Instruments is recommended as a driver; in addition to offering the required bandwidth, it provides a low offset and also offers excellent THD performance.
The phase margin of the driving operational amplifier is usually reduced by the ADC sampling capacitor. A resistor placed between the capacitor and the amplifier limits this effect; therefore, an internal $200 \Omega$ resistor ( $\mathrm{R}_{\mathrm{SER}}$ ) is placed in series with the switch. The switch resistance ( $\mathrm{R}_{\mathrm{Sw}}$ ) is typically $50 \Omega$ (see the Equivalent Input Circuit).
The differential input voltage range of the ADC is $\pm \mathrm{V}_{\text {REF }}$, the voltage at the $\mathrm{REF}_{\text {IN }}$ pin.
It is important to keep the voltage to all inputs within the 0.1 V limit below AGND and above $\mathrm{AV}_{\mathrm{DD}}$ while not allowing dc current to flow through the inputs. Current is only necessary to recharge the sample-and-hold capacitors.

## Analog-to-Digital Converter (ADC)

The ADS7865 includes two SAR-type, 2MSPS, 12-bit ADCs (shown in the Functional Block Diagram on the front page of this data sheet).

## CONVST

The analog inputs are held with the falling edge of the CONVST (conversion start) signal. The setup time of CONVST referred to the next rising edge of CLOCK (system clock) is 10 ns (minimum). The conversion automatically starts with the rising CLOCK edge. CONVST should not be issued during a conversion, that is, when BUSY is high.

## CLOCK

The ADC uses an external clock in the range of 1 MHz to 32 MHz . 12 clock cycles are needed for a complete conversion; the following clock cycle is used for pre-charging the sample capacitors and a minimum of two clock cycles are required for the sampling. With a minimum of 16 clocks used for the entire process, one clock cycle is left for the required setup and hold times along with some margin for delay caused by layout. The clock input can remain low between conversions (after applying the 16th falling edge to complete a running conversion). It can also remain low after applying the 14th falling edge during a DAC register write access if the device is not required to perform a conversion (for example, during an initiation phase after power-up).
The CLOCK duty cycle should be $50 \%$. However, the ADS7865 functions properly with a duty cycle between $30 \%$ and $70 \%$.

## RESET

The ADS7865 features an internal power-on-reset (POR) function. When the device is powered up, the POR sets the device to default mode when AVDD reaches 1.8 V .

## REF ${ }_{\text {IN }}$

The reference input is not buffered and is directly connected to the ADC. The converter generates spikes on the reference input voltage because of internal switching. Therefore, an external capacitor to the analog ground (AGND) should be used to stabilize the reference input voltage. This capacitor should be at least 470nF. Ceramic capacitors (X5R type) with values up to $1 \mu \mathrm{~F}$ are commonly available as SMD in 0402 size.

## REF ${ }_{\text {OUT }}$

The ADS7865 includes a low-drift, 2.5 V internal reference source. This source feeds a 10 -bit string DAC that is controlled via the DAC register. As a result of this architecture, the voltage at the REF pin is programmable in 2.44 mV steps and can be adjusted to specific application requirements without the use of additional external components.
However, the DAC output voltage should not be programmed below 0.5 V to ensure the correct functionality of the reference output buffer. This buffer is connected between the DAC and the REF and is capable of driving the capacitor at the $R E F_{\text {IN }}$ pin. A minimum of 470 nF is required to keep the
reference stable (see the previous discussion of $\left.R E F_{\text {IN }}\right)$. For applications that use an external reference source, the internal reference can be disabled using bit RP in the SDI Register (see the Digital section). The settling time of the REF $_{\text {OUT }}$ pin is $500 \mu \mathrm{~s}$ (max) with the reference capacitor connected. The default value of the $\mathrm{REF}_{\text {OUt }}$ pin after power-up is 2.5 V .

For operation with a 2.7 V analog supply and a 2.5 V reference, the internal reference buffer requires a rail-to-rail input and output. Such buffers typically contain two input stages; when the input voltage passes the mid-range area, a transition occurs at the output because of switching between the two input stages. In this voltage range, rail-to-rail amplifiers generally show a very poor power-supply rejection.

As a result of this poor performance, the ADS7865 buffer has a fixed transition at DAC code 509 ( $0 \times 1$ FD). At this code, the DAC may show a jump of up to 10 mV in its transfer function.
Table 3 lists some examples of internal reference DAC settings.

Table 3. Reference DAC Setting Examples

| $\mathbf{V}_{\text {REFOUT }}$ | DECIMAL <br> CODE | BINARY CODE | HEXADECIMAL <br> CODE |
| :---: | :---: | :---: | :---: |
| 0.500 V | 205 | 0011001101 | CD |
| 1.241 V | 508 | 0111111100 | 1FC |
| 1.240 V | 509 | 0111111101 | 1FD |
| 2.500 V | 1023 | 1111111111 | 3FF |

## DIGITAL

This section reviews the timing and control of the ADS7865 parallel interface.

## Configuration Register

The configuration register can be set by issuing a write access on the parallel interface. The data present on $\mathrm{DB}[11: 0$ ] are latched with the rising edge of WR. The data word width of the configuration register is 12 bits; its structure is shown in Table 4. The default value of this register after power-up is $0 \times 000$.

Table 4. Configuration Register Map

| CONFIGURATION REGISTER BIT |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{1 1}$ | $\mathbf{1 0}$ | $\mathbf{9}$ | $\mathbf{8}$ | $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |
| C 1 | C 0 | R 1 | R 0 | DP | N | AN | RP | $\mathrm{X}^{(1)}$ | A 2 | A 1 | A 0 |

(1) $\mathrm{X}=\mathrm{Don}$ 't care.

Table 5. C1 and C0: Channel Selection

|  |  | ADC A/B |  |
| :---: | :---: | :---: | :---: |
| $\mathbf{C 1}$ | $\mathbf{c o}$ | POSITIVE INPUT | NEGATIVE INPUT |
| 0 | 0 | CHA0 $+/ \mathrm{CHB} 0+$ | CHA0-/CHB0- |
| 0 | 1 | CHA1-/CHB1- | CHA0-/CHB0- |
| 1 | 0 | CHA1 + /CHB1 + | CHA0-/CHB0- |
| 1 | 1 | CHA1 $/$ /CHB1 + | CHA1-/CHB1- |

Table 6. R1 and R0: Register Update Enable

| R1 | R0 | FUNCTION |
| :---: | :---: | :--- |
| 0 | 0 | Register update disabled |
| 0 | 1 | Register update enabled |
| 1 | 0 | Reserved for factory test (don't <br> use) |
| 1 | 1 | Register update disabled |

N : Nap power-down enable
('1' = device in nap power-down mode)
AN: AutoNap power-down enable
('1' = device in autonap power-down mode)
RP: Reference power-down
(' 1 ' = reference is turned off)
Table 7. A2, A1, and A0: DAC, Sequencer, and SW-Reset Control

| A2 | A1 | A0 | FUNCTION |
| :---: | :---: | :---: | :--- |
| 0 | 0 | 0 | Configuration register <br> update only |
| 0 | 0 | 1 | Write to reference DAC <br> register with next access |
| 0 | 1 | 0 | Configuration register <br> update only |
| 0 | 1 | 1 | Read from reference <br> DAC register with next <br> access |
| 1 | 0 | 0 | Write to sequencer <br> register |
| 1 | 0 | 1 | Device SW-reset |
| 1 | 1 | 0 | Read from sequencer <br> register |
| 1 | 1 | 1 | Configuration register <br> update only |

All enabled power-down features are activated by the rising edge of the WR pulse immediately after writing to the configuration register.
Because two write accesses are required to program the reference DAC and the sequencer registers, these settings are updated with the rising edge of WR after the second write access. For more details, see the Sequencer Register and Programming the Reference DAC sections.

Figure 32 shows a complete timing diagram consisting of a write access to set up the proper input channel, followed by an initiation of a conversion and the read access of both conversion results.

The input multiplexer updates with the rising edge of the WR input. The following falling edge of CONVST triggers the conversion of the previously selected channel. The data output register then updates with the falling edge of BUSY and can be read thereafter.

The digital output code format of the ADS7865 is in binary twos complement, as shown in Table 8. Conversion results can be read out only once. A second read access (without issuing a new conversion) results in 000 h as the output value.

Figure 32. Channel Selection Timing Diagram

Table 8. ADS7865 Output Data Format

| DESCRIPTION | DIFFERENTIAL INPUT VOLTAGE (CHXX+) - (CHXX-) | INPUT VOLTAGE AT CHXX+ <br> (CHXX $-=\mathrm{V}_{\text {REF }}=2.5 \mathrm{~V}$ ) | BINARY CODE | HEXADECIMAL CODE |

| Midscale - 1LSB | - $\mathrm{V}_{\text {REF }} / 4096$ | 2.49878 V | 111111111111 | FFF |
| Negative fullscale | $-\mathrm{V}_{\text {REF }}$ | OV | 100000000000 | 800 |

## Sequencer Register

The ADS7865 features a programmable sequencer that controls the switching of the ADC input multiplexer. To set up the sequencer, two write accesses to the ADC are required. During the first write access, the programming of the sequencer must be enabled by setting $\mathrm{R}[1: 0]=$ ' 01 ' and $\mathrm{A}[2: 0]=$ ' 100 ' in the Configuration Register. The data applied to the data bus on the second write access contain the updated Sequencer Register content.
The structure of the Sequencer Register is shown in Table 9. The default value of this register after powerup is $0 \times 000$.
Detailed timing diagrams of the different sequencer modes are shown in Figure 33.
If the output data are read after the entire sequence has been converted, the output data are presented in LIFO manner (last in, first out); that is, the conversion results of ADC A is followed by ADC B data of the last channel in the sequence, followed by the ADC

A/B data of the second-last channel in the sequence, and so on. Trying to read out more results (2, 4, or 6) than the actual sequence length results in 000 h at the output of the converter. Older conversion results are overwritten if all data of a completed sequence have not been read out before issuing a new conversion start. Figure 34 shows an example where the sequencer is set to scan through the pseudodifferential inputs of the ADS7865 beginning with $\mathrm{CH} \times 1+$, followed by $\mathrm{CH} \times 1-$ and $\mathrm{CH} \times 0+$, while using a single CONVST and BUSY for the entire sequence. The internal LIFO pointer is reset with every BUSY signal rising edge. Therefore, to ensure proper data retrieval, the sequence results should either be read after completion of the entire sequence conversion or between two consecutive conversions within the sequence as indicated in Figure 34. Other read options may deliver incorrect results.

Figure 33. Sequencer Modes (Example: SL = '11')

Figure 34. Sequencer Programming Example

## Programming the Reference DAC

The internal reference DAC can be set by issuing a $\overline{\text { WR pulse while providing a control word with } \mathrm{R}[1: 0]=}$ '01' and $A[2: 0]=$ '001' (see Table 4). Thereafter, a second WR pulse must be generated with the data bus bits $\mathrm{DB}[11: 10]=$ ' 00 ' and $\mathrm{DB}[9: 0]$ containing the actual 10-bit DAC value, with DB9 being the MSB (see Figure 35).

To verify the current DAC setting, a $\overline{W R}$ pulse must be generated while providing a control word containing $\mathrm{R}[1: 0]=$ '01' and $\mathrm{A}[2: 0]=$ '011' to initialize the DAC read access. Thereafter, triggering the RD line causes the data bus to provide the 10 -bit DAC value on DB[9:0].
Table 14 shows the content of this register; the default value after power-up is $0 \times 3$ FF (see also Table 3).

Table 14. DAC Register Contents

| DAC REGISTER CONTENT |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Power-Down Modes and Reset

The ADS7865 has a comprehensive built-in powerdown feature. There are three power-down modes: deep power-down, nap power-down, and auto-nap power-down. All three power-down modes are activated with the rising $\overline{W R}$ edge after having been activated by asserting the corresponding bit in the Configuration Register (DP = ' 1 ', N = '1', or AN = ' 1 '). All modes are deactivated by de-asserting the respective bit in the Configuration Register. The contents of the Configuration Register are not affected by any of the power-down modes. Any ongoing conversion aborts when deep or nap powerdown is initiated. Table 15 lists the differences among the three power-down modes.
In deep power-down mode, all functional blocks except the digital interface are disabled. The analog block has its bias currents turned off. In this mode, the power dissipation reduces to $1 \mu \mathrm{~A}$ within $2 \mu \mathrm{~s}$. The wake-up time from deep power-down mode is $1 \mu \mathrm{~s}$.
In nap power-down mode, the ADS7865 turns off the biasing of the comparator and the mid-voltage buffer within 200 ns . The device goes into nap powerdown mode regardless of the conversion state.

The auto-nap power-down mode is very similar to the nap mode. The only differences are the methods of powering down and waking up the device. The Configuration Register bit AN is only used to enable/disable this feature. If the auto-nap mode is enabled, the ADS7865 turns off the biasing automatically after finishing a conversion; thus, the end of conversion actually activates the auto-nap power-down. The device powers down within 200ns in this mode, as well. Triggering a new conversion by applying a CONVST pulse returns the device to normal operation and automatically starts a new conversion six CLOCK cycles later. Therefore, a complete conversion cycle takes 22 CLOCK cycles; thus, the maximum throughput rate in auto-nap power-down mode is reduced to 1.45MSPS.

To issue a device reset, a write access to the Configuration Register must be generated to set $\mathrm{A}[2: 0]=$ '101'. With the rising edge of the $\overline{W R}$ input, the entire device is forced into reset. After approximately 20 ns , the parallel interface becomes active again.

Table 15. Power-Down Modes

| POWER-DOWN TYPE | $\begin{gathered} \text { ENABLED } \\ \text { BY } \\ \hline \end{gathered}$ | ACTIVATED BY | ACTIVATION TIME | RESUMED BY | REACTIVATION TIME | $\begin{gathered} \text { DISABLED } \\ \text { BY } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Deep | DP = '1' | Rising $\overline{\mathrm{WR}}$ edge | $2 \mu \mathrm{~s}$ | DP = '0' | $1 \mu \mathrm{~s}$ | DP = '0' |
| Nap | N = '1' | Rising $\overline{\mathrm{WR}}$ edge | 200ns | $\mathrm{N}=\mathrm{'O}^{\prime}$ | 6 clocks | $\mathrm{N}=\mathrm{'O}^{\prime}$ |
| Auto-nap | AN = '1' | Each end of conversion | 200ns | $\overline{\text { CONVST pulse }}$ | 6 clocks | AN = '0' |

## ADS7862 COMPATIBILITY

The ADS7865IPBS is pin-compatible with the ADS7862Y. However, there are some differences between the two devices that must be considered when migrating from the ADS7862 to the ADS7865 in an existing design.

## $\overline{W R}$ versus AO

One of the differences is that pin 22, which triggers writing to the internal Configuration Register of the ADS7865 ( $\overline{\mathrm{WR}}$ ), is used to select the input channel on the ADS7862 (A0).

Channel selection on the ADS7865 can only be performed by setting bits $\mathrm{C}[1: 0]$ in the Configuration Register or, automatically, by the sequencer (see the Sequencer Register section for details).

## REF $_{\text {IN }}$

The ADS7865 offers an unbuffered REF ${ }_{\text {IN }}$ input with a code-dependent input impedance while featuring a programmable and buffered reference output (REF ${ }_{\text {out }}$ ). The ADS7862 offers a high-impedance (buffered) reference input. If an existing ADS7862based design uses the internal reference of the device and relies on an external resistor divider to adjust the input voltage range of the ADC, migration to the ADS7865 platform requires one of the following conditions:

- A software change to set up the internal reference

DAC properly via the DAC register while removing the external resistors; or

- An additional external buffer between the resistor divider and the required 470 nF (minimum) capacitor on the REF IN input.

In the latter case, while the capacitor stabilizes the reference voltage during the entire conversion, the buffer must recharge it by providing an average current only; thus, the required minimum bandwidth of the buffer can be calculated using Equation 2:
$\mathrm{f}_{-3 \mathrm{aB}}=\frac{\ln (2) \times 2}{2 \pi \times 16 \times \mathrm{t}_{\mathrm{CLK}}}$
The buffer must also be capable of driving the 470 nF load while maintaining its stability.

## Timing

The only timing requirement that may cause the ADS7865 to malfunction in an existing ADS7862based design is the CONVST low time $\left(\mathrm{t}_{1}\right)$ which is specified to be 20 ns minimum, while the ADS7862 works properly with a pulse as short as 15 ns . All other required minimum setup and hold times are specified to be either the same as or lower than the ADS7865; therefore, there are no conflicts with the ADS7862 requirements.

## APPLICATION INFORMATION

The absolute minimum configuration of the ADS7865 in an application is shown in Figure 36. In this case, the ADS7865 is used in dual-channel mode only, with the default settings of the device after power up.
The input signal for the amplifiers must fulfill the common-mode voltage requirements of the ADS7865 in this configuration. The actual values of the resistors and capacitors depend on the bandwidth and performance requirements of the application.
Those values can be calculated using Equation 3, with $n=12$ being the resolution of the ADS7865.
$\mathrm{f}_{\text {FILTER }}=\frac{\ln (2) \times(\mathrm{n}+1)}{2 \times \pi \times 2 \times \mathrm{R} \times \mathrm{C}}$
It is recommended to use a capacitor value of at least 20pF.
Keep the acquisition time in mind; the resistor value can be calculated as shown in Equation 4 for each of the series resistors (with $n=12$, the resolution of the ADS7865).

$$
\begin{equation*}
R=\frac{t_{A C Q}}{\ln (2) \times(n+1) \times 2 \times C} \tag{4}
\end{equation*}
$$

Figure 36. Minimum ADS7865 Configuration

## LAYOUT

For optimum performance, care should be taken with the physical layout of the ADS7865 circuitry. This caution is particularly true if the CLOCK input approaches the maximum throughput rate. In this case, it is recommended to have a fixed phase relationship between CLOCK and CONVST.
Additionally, the basic SAR architecture is quite sensitive to glitches or sudden changes on the power supply, reference, ground connections, and digital inputs that occur just before latching the output of the analog comparator. Therefore, when driving any single conversion for an $n$-bit SAR converter, there are $n$ windows in which large external transient voltages can affect the conversion result. Such glitches might originate from switching power supplies, nearby digital logic, or high-power devices. The degree of error in the digital output depends on the reference voltage, layout, and the exact timing of the external event. These errors can change if the external event also changes in time with respect to the CLOCK input.
With this possibility in mind, power to the ADS7865 should be clean and well-bypassed. A $0.1 \mu \mathrm{~F}$ ceramic bypass capacitor should be placed as close to the device as possible. In addition, a $1 \mu \mathrm{~F}$ to $10 \mu \mathrm{~F}$ capacitor is recommended. If needed, an even larger capacitor and a $5 \Omega$ or $10 \Omega$ series resistor may be used to low-pass filter a noisy supply.
If the reference voltage is external and originates from an operational amplifier, be sure that it can drive the reference capacitor without oscillation. The connection between the output of the external reference driver and $R E F_{\text {IN }}$ should be of low resistance ( $10 \Omega \mathrm{max}$ ) to minimize any codedependent voltage drop on this path.

## Grounding

All ground (AGND and BGND) pins should be connected to a clean ground reference. These connections should be kept as short as possible to minimize the inductance of these paths. It is recommended to use vias connecting the pads directly to the ground plane. In designs without ground planes, the ground trace should be kept as wide as possible. Avoid connections that are too near the grounding point of a microcontroller or digital signal processor.

Depending on the circuit density of the board, placement of the analog and digital components, and the related current loops, a single solid ground plane for the entire printed circuit board (PCB) or a dedicated analog ground area may be used. In an instance of a separated analog ground area, ensure a low-impedance connection between the analog and digital ground of the ADC by placing a bridge underneath (or next to) the ADC. Otherwise, even short undershoots on the digital interface with a value lower than -300 mV may lead to conduction of ESD diodes, causing current flow through the substrate and degrading the analog performance.

During the PCB layout process, care should also be taken to avoid any return currents crossing any sensitive analog areas or signals. No signal must exceed the limit of -300 mV with regard to the respective ground plane. Figure 37 illustrates the recommended layout of the ground and power-supply connections.

## Supply

The ADS7865 has two separate supplies: the $\mathrm{BV}_{\mathrm{DD}}$ pin for the digital interface and the $A V_{D D}$ pin for all remaining circuits.
$\mathrm{BV}_{\mathrm{DD}}$ can range from 2.7 V to 5.5 V , allowing the ADS7865 to easily interface with processors and controllers. To limit the injection of noise energy from external digital circuitry, $B V_{D D}$ should be filtered properly. Bypass capacitors of $0.1 \mu \mathrm{~F}$ and $10 \mu \mathrm{~F}$ should be placed between the $B V_{D D}$ pin and the ground plane.
$A V_{D D}$ supplies the internal analog circuitry. For optimum performance, a linear regulator (for example, the UA7805 family) is recommended to generate the analog supply voltage in the range of 2.7 V to 5.5 V for the ADS7865 and the necessary analog front-end circuitry.
Bypass capacitors should be connected to the ground plane such that the current is allowed to flow through the pad of the capacitor (that is, the vias should be placed on the opposite side of the connection between the capacitor and the power-supply pin of the ADC).

## Digital Interface

To further optimize device performance, a series resistor of $10 \Omega$ to $100 \Omega$ can be used on each digital pin of the ADS7865. In this way, the slew rates of the input and output signals are reduced, limiting the noise injection from the digital interface.

TEXAS INSTRUMENTS

## REVISION HISTORY

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.
Changes from Revision B (May 2010) to Revision C Page

- Deleted Ordering Information table ..... 2
Changes from Revision A (June 2009) to Revision B ..... Page
- Deleted footnote 2 from Electrical Characteristics table ..... 3
- Changed RESET section of Applications Information ..... 16
- Added last sentence in final paragraph of the Configuration Register section ..... 18
- Changed last paragraph of Sequencer Register section ..... 19
- Updated Figure 33 ..... 20
- Updated Figure 34 ..... 20

## PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan <br> (2) | Lead/Ball Finish <br> (6) | MSL Peak Temp <br> (3) | Op Temp ( ${ }^{\circ} \mathrm{C}$ ) | Device Marking <br> (4/5) | Samples |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADS7865IPBS | ACTIVE | TQFP | PBS | 32 | 250 | Green (RoHS \& no $\mathrm{Sb} / \mathrm{Br}$ ) | CU NIPDAU | Level-2-260C-1 YEAR | -40 to 125 | 7865I A | Samples |
| ADS7865IPBSG4 | ACTIVE | TQFP | PBS | 32 | 250 | Green (RoHS \& no $\mathrm{Sb} / \mathrm{Br}$ ) | CU NIPDAU | Level-2-260C-1 YEAR | -40 to 125 | 7865I A | Samples |
| ADS7865IPBSR | ACTIVE | TQFP | PBS | 32 | 1000 | Green (RoHS \& no Sb/Br) | CU NIPDAU | Level-2-260C-1 YEAR | -40 to 125 | 78651 A | Samples |

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS \& no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb -Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb -Free (RoHS compatible) as defined above.
Green (RoHS \& no Sb/Br): Tl defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine ( Br ) and Antimony ( Sb ) based flame retardants ( Br or Sb do not exceed $0.1 \%$ by weight in homogeneous material)
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a " $\sim$ " will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and
continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

REEL DIMENSIONS

TAPE DIMENSIONS

| A0 | Dimension designed to accommodate the component width |
| :---: | :--- |
| B0 | Dimension designed to accommodate the component length |
| K0 | Dimension designed to accommodate the component thickness |
| W | Overall width of the carrier tape |
| P1 | Pitch between successive cavity centers |

TAPE AND REEL INFORMATION

PBS (S-PQFP-G32) PLASTIC QUAD FLATPACK

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.

PBS (S-PQFP-G32)

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC -7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
E. Customers should contact their board fabrication site for recommended solder mask tolerances between and around signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

Tl's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.
Tl's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate Tl products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.
Tl's provision of TI Resources does not expand or otherwise alter Tl's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such Tl Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI .
TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.
Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.
TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify Tl and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's noncompliance with the terms and provisions of this Notice.

[^0]:    Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

[^1]:    (1) Tested in accordance with the High-K thermal metric definitions of EIA/JESD51-3 for leaded surface-mount packages with a $3 \times 3$ via array.
