

Si823x Data Sheet

0.5 and 4.0 Amp ISOdrivers (2.5 and 5 kV_{RMS})

The Si823x isolated driver family combines two independent, isolated drivers into a single package. The Si8230/1/3/4 are high-side/low-side drivers, while the Si8232/5/7/8 are dual drivers. Versions with peak output currents of 0.5 A (Si8230/1/2/7) and 4.0 A (Si8233/4/5/8) are available. All drivers operate with a maximum supply voltage of 24 V.

The Si823x drivers utilize Silicon Labs' proprietary silicon isolation technology, which provides up to 5 kV_{RMS} withstand voltage per UL1577 and fast 45 ns propagation times. Driver outputs can be grounded to the same or separate grounds or connected to a positive or negative voltage. The TTL level compatible inputs with >400 mV hysteresis are available in individual control input (Si8230/2/3/5/7/8) or PWM input (Si8231/4) configurations. High integration, low propagation delay, small installed size, flexibility, and cost-effectiveness make the Si823x family ideal for a wide range of isolated MOSFET/IGBT gate drive applications.

Automotive Grade is available for certain part numbers. These products are built using automotive-specific flows at all steps in the manufacturing process to ensure the robustness and low defectivity required for automotive applications.

Industrial Applications

- Power delivery systems
- Motor control systems
- Isolated dc-dc power supplies
- Lighting control systems
- Plasma displays
- Solar and industrial inverters

Automotive Applications

- On-board chargers
- Battery management systems
- Charging stations
- Traction inverters
- Hybrid Electric Vehicles
- Battery Electric Vehicles

Safety Regulatory Approvals

- UL 1577 recognized
 - Up to 5000 V_{RMS} for 1 minute
- CSA component notice 5A approval
 - IEC 60950-1, 62368-1, 60601-1 (reinforced insulation)
- VDE certification conformity
 - VDE 0884-10
 - EN60950-1 (reinforced insulation)
- CQC certification approval
 - GB4943.1

KEY FEATURES

- Two completely isolated drivers in one package
 - Up to 5 kV_{RMS} input-to-output isolation
 - Up to 1500 V_{DC} peak driver-to-driver differential voltage
- HS/LS and dual driver versions
- Up to 8 MHz switching frequency
- 0.5 A peak output (Si8230/1/2/7)
- 4.0 A peak output (Si8233/4/5/8)
- High electromagnetic immunity
- RoHS-compliant packages:
 - SOIC-14/16 wide body
 - SOIC-16 narrow body
 - LGA-14
 - QFN-14 (pin to pin compatible with LGA-14 packages)
- AEC-Q100 qualification
- Automotive-grade OPNs available
 - AIAG compliant PPAP documentation support
 - IMDS and CAMDS listing support

Automotive Grade OPNs

Automotive-grade devices are built using automotive-specific flows at all steps in the manufacturing process to ensure robustness and low defectivity. These devices are supported with AIAG-compliant Production Part Approval Process (PPAP) documentation, and feature International Material Data System (IMDS) and China Automotive Material Data System (CAMDS) listing. Qualifications are compliant with AEC-Q100, and a zero-defect methodology is maintained throughout definition, design, evaluation, qualification, and mass production steps.

2.2 Functional Description

The operation of an Si823x channel is analogous to that of an optocoupler and gate driver, except an RF carrier is modulated instead of light. This simple architecture provides a robust isolated data path and requires no special considerations or initialization at start-up. A simplified block diagram for a single Si823x channel is shown in the figure below.

Figure 2.4. Simplified Channel Diagram

A channel consists of an RF Transmitter and RF Receiver separated by a semiconductor-based isolation barrier. Referring to the Transmitter, input A modulates the carrier provided by an RF oscillator using on/off keying. The Receiver contains a demodulator that decodes the input state according to its RF energy content and applies the result to output B via the output driver. This RF on/off keying scheme is superior to pulse code schemes as it provides best-in-class noise immunity, low power consumption, and better immunity to magnetic fields. See the figure below for more details.

Notes:						
1. This truth table assumes VDDA and VDDB are powered. If VDDA and VDDB are below UVLO, see 2.9 Undervoltage Lockout Operation for more information.						
2. Note that an input can power the input die through an internal diode if its source has adequate current.						

2.6 Power Supply Connections

Isolation requirements mandate individual supplies for VDDI, VDDA, and VDDB. The decoupling caps for these supplies must be placed as close to the VDD and GND pins of the Si823x as possible. The optimum values for these capacitors depend on load current and the distance between the chip and the regulator that powers it. Low effective series resistance (ESR) capacitors, such as Tantalum, are recommended.

2.7 Power Dissipation Considerations

Proper system design must assure that the Si823x operates within safe thermal limits across the entire load range. The Si823x total power dissipation is the sum of the power dissipated by bias supply current, internal parasitic switching losses, and power dissipated by the series gate resistor and load. Equation 1 shows total Si823x power dissipation.

$$P_D = (V_{DD1})(I_{DD1}) + 2(I_{DD2})(V_{DD2}) + \left(f\right)\left(Q_{TL}\right)\left(V_{DD2}\right)\left[\frac{R_p}{R_p + R_g}\right] + \left(f\right)\left(Q_{TL}\right)\left(V_{DD2}\right)\left[\frac{R_p}{R_p + R_g}\right] + 2fC_{int}V_{DD2}^2$$

where:

P_D is the total Si823x device power dissipation (W)

I_{DD1} is the input-side maximum bias current (3 mA)

I_{DD2} is the driver die maximum bias current (2.5 mA)

C_{int} is the internal parasitic capacitance (75 pF for the 0.5 A driver and 370 pF for the 4.0 A driver)

V_{DD1} is the input-side VDD supply voltage (2.7 to 5.5 V)

V_{DD2} is the driver-side supply voltage (10 to 24 V)

f is the switching frequency (Hz)

Q_{TL} is the gate charge of the FET being driven

R_G is the external gate resistor

R_p is the $R_{DS(ON)}$ of the driver pull-up switch: ($R_p = 15 \Omega$ for the 0.5 A driver; $R_p = 2.7 \Omega$ for the 4.0 A driver)

R_n is the $R_{DS(ON)}$ of the driver pull-down switch: ($R_n = 5 \Omega$ for the 0.5 A driver and 1Ω for the 4.0 A driver)

Equation 1

Power dissipation example for 0.5 A driver using Equation 1 with the following givens:

$$V_{DD1} = 5.0 \text{ V}$$

$$V_{DD2} = 12 \text{ V}$$

$$f = 350 \text{ kHz}$$

$$R_G = 22 \Omega$$

$$Q_{TL} = 25 \text{ nC}$$

$$P_d = 0.015 + 0.060 + \left(350 \times 10^3\right)\left(25 \times 10^{-9}\right)\left(12\right)\left[\frac{5}{5 + 22}\right] + 2\left[\left(350 \times 10^3\right)\left(75 \times 10^{-12}\right)\left(144\right)\right] = 145 \text{ mW}$$

From which the driver junction temperature is calculated using Equation 2, where:

P_d is the total Si823x device power dissipation (W)

θ_{ja} is the thermal resistance from junction to air (105 °C/W in this example)

T_A is the ambient temperature

$$T_j = P_d \times \theta_{ja} \times T_A = (0.145)(105) + 20 = 35.2^\circ\text{C}$$

The maximum power dissipation allowable for the Si823x is a function of the package thermal resistance, ambient temperature, and maximum allowable junction temperature, as shown in Equation 2:

$$P_{Dmax} \leq \frac{T_{jmax} - T_A}{\theta_{ja}}$$

where:

P_{Dmax} = Maximum Si823x power dissipation (W)

T_{jmax} = Si823x maximum junction temperature (150 °C)

T_A = Ambient temperature (°C)

θ_{ja} = Si823x junction-to-air thermal resistance (105 °C/W)

f = Si823x switching frequency (Hz)

Equation 2

Substituting values for P_{Dmax} , T_{jmax} , T_A , and θ_{ja} into Equation 2 results in a maximum allowable total power dissipation of 1.19 W. Maximum allowable load is found by substituting this limit and the appropriate data sheet values from [Table 3.1 Electrical Characteristics¹ on page 26](#) into Equation 1 and simplifying. The result is Equation 3 (0.5 A driver) and Equation 4 (4.0 A driver), both of which assume $V_{DDI} = 5\text{ V}$ and $V_{DDA} = V_{VDD} = 18\text{ V}$.

$$C_{L(MAX)} = \frac{1.4 \times 10^{-3}}{f} - 7.5 \times 10^{-11}$$

Equation 3

$$C_{L(MAX)} = \frac{1.4 \times 10^{-3}}{f} - 3.7 \times 10^{-10}$$

Equation 4

Equation 3 and Equation 4 are graphed in the figure below, where the points along the load line represent the package dissipation-limited value of C_L for the corresponding switching frequency.

2.8 Layout Considerations

It is most important to minimize ringing in the drive path and noise on the Si823x VDD lines. Care must be taken to minimize parasitic inductance in these paths by locating the Si823x as close to the device it is driving as possible. In addition, the VDD supply and ground trace paths must be kept short. For this reason, the use of power and ground planes is highly recommended. A split ground plane system having separate ground and VDD planes for power devices and small signal components provides the best overall noise performance.

2.9 Undervoltage Lockout Operation

Device behavior during start-up, normal operation and shutdown is shown in [Figure 2.30 Device Behavior during Normal Operation and Shutdown on page 22](#), where UVLO+ and UVLO- are the positive-going and negative-going thresholds respectively. Note that outputs VOA and VOB default low when input side power supply (VDDI) is not present.

2.9.1 Device Startup

Outputs VOA and VOB are held low during power-up until VDD is above the UVLO threshold for time period t_{START} . Following this, the outputs follow the states of inputs VIA and VIB.

2.9.2 Undervoltage Lockout

Undervoltage Lockout (UVLO) is provided to prevent erroneous operation during device startup and shutdown or when VDD is below its specified operating circuits range. The input (control) side, Driver A and Driver B, each have their own undervoltage lockout monitors.

The Si823x input side enters UVLO when $VDDI \leq VDDI_{UV-}$, and exits UVLO when $VDDI > VDDI_{UV+}$. The driver outputs, VOA and VOB, remain low when the input side of the Si823x is in UVLO and their respective VDD supply (VDDA, Vddb) is within tolerance. Each driver output can enter or exit UVLO independently. For example, VOA unconditionally enters UVLO when VDDA falls below $VDDA_{UV-}$ and exits UVLO when VDDA rises above $VDDA_{UV+}$.

Figure 2.30. Device Behavior during Normal Operation and Shutdown

2.9.3 Undervoltage Lockout (UVLO)

The UVLO circuit unconditionally drives VO low when VDD is below the lockout threshold. Upon power up, the Si823x is maintained in UVLO until VDD rises above VDD_{UV+} . During power down, the Si823x enters UVLO when VDD falls below the UVLO threshold plus hysteresis (i.e., $VDD \leq VDD_{UV+} - VDD_{HYS}$).

2.9.4 Control Inputs

VIA, VIB, and PWM inputs are high-true, TTL level-compatible logic inputs. A logic high signal on VIA or VIB causes the corresponding output to go high. For PWM input versions (Si8231/4), VOA is high and VOB is low when the PWM input is high, and VOA is low and VOB is high when the PWM input is low.

2.9.5 Disable Input

When brought high, the DISABLE input unconditionally drives VOA and VOB low regardless of the states of VIA and VIB. Device operation terminates within t_{SD} after $DISABLE = V_{IH}$ and resumes within $t_{RESTART}$ after $DISABLE = V_{IL}$. The DISABLE input has no effect if VDDI is below its UVLO level (i.e., VOA, VOB remain low).

2.10 Programmable Dead Time and Overlap Protection

All high-side/low-side drivers (Si8230/1/3/4) include programmable overlap protection to prevent outputs VOA and VOB from being high at the same time. These devices also include programmable dead time, which adds a user-programmable delay between transitions of VOA and VOB. When enabled, dead time is present on all transitions, even after overlap recovery. The amount of dead time delay (DT) is programmed by a single resistor (RDT) connected from the DT input to ground per Equation 5. Note that the dead time pin can be tied to VDD1 or left floating to provide a nominal dead time at approximately 400 ps.

$$DT \approx 10 \times RDT$$

where:

DT = dead time (ns) and

RDT = dead time programming resistor (k Ω)

Equation 5

The device driving VIA and VIB should provide a minimum dead time of TDD to avoid activating overlap protection. Input/output timing waveforms for the two-input drivers are shown in [Figure 2.31 Input / Output Waveforms for High-Side / Low-Side Two-Input Drivers on page 24](#), and dead time waveforms are shown in [Figure 2.32 Dead Time Waveforms for High-Side / Low-Side Two-input Drivers on page 25](#).

Notes:

- The values in this table correspond to the nominal creepage and clearance values as detailed in [6.1 Package Outline: 16-Pin Wide Body SOIC](#), [6.2 Package Outline: 14-Pin Wide Body SOIC](#), [6.3 Package Outline: 16-Pin Narrow Body SOIC](#), [6.4 Package Outline: 14 LD LGA \(5 x 5 mm\)](#), [6.5 Package Outline: 14 LD QFN](#). VDE certifies the clearance and creepage limits as 4.7 mm minimum for the NB SOIC and 8.5 mm minimum for the WB SOIC package. UL does not impose a clearance and creepage minimum for component level certifications. CSA certifies the clearance and creepage of the WB SOIC package with designation "IS3" as 8 mm minimum. CSA certifies the clearance and creepage limits as 3.9 mm minimum for the NB SOIC and 7.6 mm minimum for the WB SOIC package with package designation "IS" as listed in the data sheet.
- To determine resistance and capacitance, the Si823x is converted into a 2-terminal device. Pins 1–8 (1–7, 14 LD LGA/QFN) are shorted together to form the first terminal and pins 9–16 (8–14, 14 LD LGA/QFN) are shorted together to form the second terminal. The parameters are then measured between these two terminals.
- Measured from input pin to ground.

Notes:

1. Permanent device damage may occur if the absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as specified in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. VDE certifies storage temperature from -40 to 150 °C.

4.2 Dual Driver

The figure below shows the Si823x configured as a dual driver. Note that the drain voltages of Q1 and Q2 can be referenced to a common ground or to different grounds with as much as 1500 V dc between them.

Figure 4.2. Si8232/5/7/8 in a Dual Driver Application

Because each output driver resides on its own die, the relative voltage polarities of VOA and VOB can reverse without damaging the driver. That is, the voltage at VOA can be higher or lower than that of VOB by VDD without damaging the driver. Therefore, a dual driver in a low-side high side/low side drive application can use either VOA or VOB as the high side driver. Similarly, a dual driver can operate as a dual low-side or dual high-side driver and is unaffected by static or dynamic voltage polarity changes.

Dimension	(mm)
C1	4.20
E	0.65
X1	0.80
Y1	0.40

Notes:

General

- All dimensions shown are in millimeters (mm).
- This Land Pattern Design is based on the IPC-7351 guidelines.
- All dimensions shown are at Maximum Material Condition (MMC). Least Material Condition (LMC) is calculated based on a Fabrication Allowance of 0.05 mm.

Solder Mask Design

- All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 μm minimum, all the way around the pad.

Stencil Design

- A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
- The stencil thickness should be 0.125 mm (5 mils).
- The ratio of stencil aperture to land pad size should be 1:1.

Card Assembly

- A No-Clean, Type-3 solder paste is recommended.
- The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

9. Revision History

Revision 2.12

May 2018

- Updated the Ordering Guide for Automotive-Grade OPN options.

Revision 2.1.1

January 2018

- Added new table to Ordering Guide for Automotive-Grade OPN options.

Revision 2.1

October 2017

- Added IS3 and IM1 packaging options
- Added IEC 62368-1 references throughout
- Changed max propagation delay spec from 60 ns to 45 ns based on new test limits
- Removed references to IEC 61010
- Removed references to IEC 60747, replaced with references to VDE 0884-10

Revision 2.0

August 7, 2017

Revision 1.9

July 7, 2017

- Updated [1. Ordering Guide](#) to designate tape and reel packaging option.

Revision 1.8

May 17, 2016

- Converted document from Framemaker to DITA.

Revision 1.7

- Updated [3.1 Test Circuits](#)
 - Added CQC certificate numbers.
- Updated [Table 3.3 Insulation and Safety-Related Specifications on page 31](#)
 - Updated Erosion Depth.
- Updated [Table 3.5 VDE 0884-10 Insulation Characteristics¹ on page 32](#)
 - Updated V_{PR} for WBSOIC-16.
- Updated [Table 3.8 Absolute Maximum Ratings¹ on page 34](#)
 - Removed I_o and added Peak Output Current specifications.
- Updated Equation 1.
- Updated [Figure 4.1 Si823x in Half-Bridge Application on page 35](#).
- Updated [Figure 4.2 Si8232/5/7/8 in a Dual Driver Application on page 36](#).
- Updated Ordering Guide [Table 1.1 Si823x Ordering Guide^{1, 2, 3} on page 2](#)

Revision 1.6

- Updated [Table 1.1 Si823x Ordering Guide^{1, 2, 3} on page 2](#), Ordering Part Numbers.
- Added Revision D Ordering Part Numbers.
- Removed all Ordering Part Numbers of previous revisions.

Revision 1.5

- Updated [Table 3.1 Electrical Characteristics¹](#) on page 26, input and output supply current.
- Added references to AEC-Q100 qualified throughout.
- Changed all 60747-5-2 references to 60747-5-5.
- Added references to CQC throughout.
- Updated pin descriptions throughout.
 - Corrected dead time default to 400 ps from 1 ns.
- Updated [Table 1.1 Si823x Ordering Guide^{1, 2, 3}](#) on page 2, Ordering Part Numbers.
 - Removed moisture sensitivity level table notes.

Revision 1.4

- Updated [1. Ordering Guide](#).
 - Updated "3 V VDDI Ordering Options".

Revision 1.3

- Added Si8237/8 throughout.
- Updated [Table 3.1 Electrical Characteristics¹](#) on page 26.
- Updated [Figure 3.1 IOL Sink Current Test Circuit](#) on page 29.
- Updated [Figure 3.2 IOH Source Current Test Circuit](#) on page 29.
- Added [Figure 3.3 Common Mode Transient Immunity Test Circuit](#) on page 30.
- Updated Si823x Family Truth Table to include notes 1 and 2.
- Updated [2.10 Programmable Dead Time and Overlap Protection](#).
- Removed references to Figures 26A and 26B.
- Updated [Table 1.1 Si823x Ordering Guide^{1, 2, 3}](#) on page 2.
- Added Si8235-BA-C-IS1 ordering part number.
- Added table note.

Revision 1.2

- Updated [1. Ordering Guide](#).
 - Updated moisture sensitivity level (MSL) for all package types.
- Updated [Table 3.8 Absolute Maximum Ratings¹](#) on page 34.
 - Added junction temperature spec.
- Updated [3.1 Test Circuits](#) with new notes.
- Updated Figures [Figure 2.16 Output Sink Current vs. Supply Voltage](#) on page 14, [Figure 2.14 Output Source Current vs. Supply Voltage](#) on page 13, [Figure 2.17 Output Sink Current vs. Temperature](#) on page 14, and [Figure 2.15 Output Source Current vs. Temperature](#) on page 13 to reflect correct y-axis scaling.
- Updated [Figure 4.2 Si8232/5/7/8 in a Dual Driver Application](#) on page 36.
- Updated .
- Updated [6.1 Package Outline: 16-Pin Wide Body SOIC](#).
- Updated [Table 6.1 Package Diagram Dimensions](#) on page 43.
- Change references to 1.5 kV_{RMS} rated devices to 1.0 kV_{RMS} throughout.
- Updated [2.7 Power Dissipation Considerations](#).

Revision 1.1

- Updated .
 - Updated CMTI specification.
- Updated [Table 3.1 Electrical Characteristics¹](#) on page 26.
 - Updated CMTI specification.
- Updated [Table 3.5 VDE 0884-10 Insulation Characteristics¹](#) on page 32.
- Updated [4.2 Dual Driver](#).
- Updated [1. Ordering Guide](#).
- Replaced pin descriptions on page 1 with chip graphics.

Revision 1.0

- Updated [Tables 3.1 Test Circuits](#), [Table 3.3 Insulation and Safety-Related Specifications on page 31](#), [Table 3.4 IEC 60664-1 Ratings on page 32](#), and [Table 3.5 VDE 0884-10 Insulation Characteristics¹ on page 32](#).
- Updated [1. Ordering Guide](#).
 - Added 5 V UVLO ordering options
- Added Device Marking sections.

Revision 0.3

- Moved Sections 2, 3, and 4 to after Section 5.
- Updated [Tables Table 5.4 Si8233 Two-Input HS/LS Isolated Driver \(14 LD LGA and QFN\) on page 40](#), [Table 5.5 Si8234 PWM Input HS/LS Isolated Driver \(14 LD LGA and QFN\) on page 41](#).
 - Removed Si8230, Si8231, and Si8232 from pinout and from title.
- Updated and added Ordering Guide footnotes.
- Updated UVLO specifications in [Table 3.1 Electrical Characteristics¹ on page 26](#).
- Added PWD and Output Supply Active Current specifications in [Table 3.1 Electrical Characteristics¹ on page 26](#).
- Updated and added typical operating condition graphs in [2.3 Typical Operating Characteristics \(0.5 Amp\)](#) and [2.4 Typical Operating Characteristics \(4.0 Amp\)](#).

Revision 0.2

- Updated all specs to reflect latest silicon revision.
- Updated [Table 3.1 Electrical Characteristics¹ on page 26](#) to include new UVLO options.
- Updated [Table 3.8 Absolute Maximum Ratings¹ on page 34](#) to reflect new maximum package isolation ratings
- Added Figures 34, 35, and 36.
- Updated Ordering Guide to reflect new package offerings.
- Added "Undervoltage Lockout (UVLO)" section to describe UVLO operation.

Revision 0.11

- Initial release.

Smart.
Connected.
Energy-Friendly.
