LM2480
80V Triple Bias Clamp

General Description
The LM2480 driver is an integrated 80V triple bias clamp circuit for DC recovery of each of the AC coupled outputs of a CRT driver. It is well matched with the DAC outputs of the LM126X family of pre-amplifiers. Each amplifier has its gain internally set to -18. The IC is packaged in an industry standard 8 lead molded DIP package.

Features
- Wide range integrated triple bias clamp
- High input impedance
- Single supply operation
- Matched to the LM126X family of pre-amplifiers

Recommended Applications
- CRT monitors requiring DC restoration at the cathodes

Order Number LM2480NA
NS Package Number: N08E
Absolute Maximum Ratings  (Note 1)
If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage, \( V_{CC} \) +90V
Input Voltage, \( V_{IN} \) 0V to 5V
Storage Temperature Range, \( T_{STG} \) -65°C to +150°C
Lead Temperature (Soldering, <10sec.) 300°C
ESD Tolerance

Limits of Operating Ranges  (Note 3)

- Supply Voltage, \( V_{CC} \) 70V to 85V
- Input Voltage, \( V_{IN} \) 10V to \( V_{DC} \)
- Ambient Temperature Range, \( T_{A} \) 0 to 70°C

</table>

Note 1: Linearity Error is the variation in DC gain from \( V_{IN} = 1.0V \) to \( V_{IN} = 4.0V \).
Note 2: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur.
Note 3: Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. For guaranteed specifications and the test conditions, see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may change when the device is not operated under the listed test conditions.
Note 4: All voltages are measured with respect to GND, unless otherwise specified.

Test Circuit

Figure 3 shows the test circuit for evaluation of the LM2480 Clamp Amplifier. A high impedance VM (>100MΩ) is used for DC measurements at the output.
THEORY OF OPERATION

The circuit diagram of the LM2480 is shown in Figure 1. The DC clamp circuit amplifies the input signal by -18 and the gain is set by the resistor ratio of 18R and R. The output requires pull-up resistor to 80V. Figure 2 shows the test circuit used for evaluation of the LM2480 Clamp Amplifier. A high impedance voltmeter (>$100\,\Omega$) is used for DC measurements at the output. The DC transfer function is shown in Figure 4.

APPLICATION HINTS

Power Supply Bypass

The LM2480 should have proper power supply bypassing for optimum performance. A $0.1\,\mu F$ capacitor should be connected from the supply pin, $V_{cc}$ to ground, as close to the supply and ground pins as is practical. Additionally, a $1.0\,\mu F$ electrolytic capacitor should be connected from the supply pin to ground. The electrolytic capacitor should also be placed reasonably close to the LM2480's supply and ground pins.

Application Circuit

The application circuit shown in Figure 5 is designed to help clamp the voltage at the output of the driver to the desired level. Capacitor $C_s$ stabilizes the entire node at the anode of the clamp diode, $D_3$, by creating a low impedance at high frequencies. Figure 5 also shows the standard application circuit topology when used with an LM246X CRT driver. It shows all the components necessary to optimize performance as well as to protect against damage from a CRT arc event. No additional components are required to protect the LM2480 from arc damage.

Demonstration Hardware

National Semiconductor has designed a demonstration neckboard for the LM126X, LM246X, and the LM2480 chipset. To obtain demonstration boards contact the National Semiconductor Sales Office in your region.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.

2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

National does not assume any responsibility for use of any circuitry described, no circuit patent licenses are implied and National reserves the right at any time without notice to change said circuitry and specifications.
